VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1763 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24644] The complementary binding of VGAM1763 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1763 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24645] It is appreciated that VGAM1763 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1763 host target genes. The mRNA of each one of this plurality of VGAM1763 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1763 RNA, herein designated VGAM RNA, and which when bound by VGAM1763 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1763 host target proteins.

[24646] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1763 gene, herein designated VGAM GENE, on one or more VGAM1763 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24647] It is yet further appreciated that a function of VGAM1763 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of viral infection by Bovine viral diarrhea virus genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1763 correlate with, and may be deduced from, the identity of the host target genes which VGAM1763 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24648] Nucleotide sequences of the VGAM1763 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1763 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1763 are further described hereinbelow with reference to Table 1.

[24649] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1763 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24650] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1764 (VGAM1764) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24651] VGAM1764 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1764 was detected is described hereinabove with reference to Figs. 2-8.

[24652] VGAM1764 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2). VGAM1764 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24653] VGAM1764 gene, herein designated VGAM GENE, encodes

a VGAM1764 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1764 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1764 precursor RNA is designated SEQ ID:1750, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1750 is located at position 3861 relative to the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2).

[24654] VGAM1764 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24655] An enzyme complex designated DICER COMPLEX, dices the VGAM1764 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1764 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1764 RNA is designated SEQ ID:4475, and is provided hereinbelow with reference to the sequence listing part.

[24656] VGAM1764 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24657] VGAM1764 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1764 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24658] The complementary binding of VGAM1764 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1764

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1764 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24659] It is appreciated that VGAM1764 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1764 host target genes. The mRNA of each one of this plurality of VGAM1764 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1764 RNA, herein designated VGAM RNA, and which when bound by VGAM1764 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1764 host target proteins.

[24660] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1764 gene, herein designated VGAM GENE, on one or more VGAM1764 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24661] It is yet further appreciated that a function of VGAM1764 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of viral infection by Bovine viral diarrhea virus genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1764 correlate with, and may be deduced from, the identity of the host target genes which VGAM1764 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24662] Nucleotide sequences of the VGAM1764 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1764 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1764 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1764 are further described hereinbelow with reference to Table 1.

[24663] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1764 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24664] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1765 (VGAM1765) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24665] VGAM1765 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1765 was detected is described hereinabove with reference to Figs. 2-8.

[24666] VGAM1765 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2). VGAM1765 host target gene, herein designated VGAM HOST TARGET GENE, is a human

gene contained in the human genome.

[24667] VGAM1765 gene, herein designated VGAM GENE, encodes a VGAM1765 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1765 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1765 precursor RNA is designated SEQ ID:1751, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1751 is located at position 9624 relative to the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2).

[24668] VGAM1765 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24669] An enzyme complex designated DICER COMPLEX, dices the VGAM1765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1765 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1765 RNA is designated SEQ ID:4476, and is provided hereinbelow with reference to the sequence listing part.

[24670] VGAM1765 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24671] VGAM1765 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1765 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1765 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24672] The complementary binding of VGAM1765 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1765 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1765 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24673] It is appreciated that VGAM1765 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1765 host target genes. The mRNA of each one of this plurality of VGAM1765 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1765 RNA, herein designated VGAM RNA, and which when bound by VGAM1765 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1765 host target proteins.

[24674] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1765 gene, herein designated VGAM GENE, on one or more VGAM1765 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24675] It is yet further appreciated that a function of VGAM1765 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1765 include diagnosis, prevention and treatment of viral infection by Bovine viral diarrhea virus genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1765 correlate with, and may be deduced from, the identity of the host target genes which VGAM1765 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24676] Nucleotide sequences of the VGAM1765 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1765 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1765 are further described hereinbelow with reference to Table 1.

[24677] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1765 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24678] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1766 (VGAM1766) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24679] VGAM1766 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1766 was detected is described hereinabove with reference to Figs. 2-8.

[24680] VGAM1766 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine viral diarrhea

virus genotype 2 (BVDV-2). VGAM1766 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24681] VGAM1766 gene, herein designated VGAM GENE, encodes a VGAM1766 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1766 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1766 precursor RNA is designated SEQ ID:1752, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1752 is located at position 5325 relative to the genome of Bovine viral diarrhea virus genotype 2 (BVDV-2).

[24682] VGAM1766 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24683] An enzyme complex designated DICER COMPLEX, dices the VGAM1766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1766 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1766 RNA is designated SEQ ID:4477, and is provided hereinbelow with reference to the sequence listing part.

[24684] VGAM1766 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24685] VGAM1766 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1766 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24686] The complementary binding of VGAM1766 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1766 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24687] It is appreciated that VGAM1766 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1766 host target genes. The mRNA of each one of this plurality of VGAM1766 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1766 RNA, herein designated VGAM RNA, and which when bound by VGAM1766 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1766 host target proteins.

[24688] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1766 gene, herein designated VGAM GENE, on one or more VGAM1766 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24689] It is yet further appreciated that a function of VGAM1766 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of viral infection by Bovine viral diarrhea virus genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1766 correlate with, and may be deduced from, the identity of the host target genes which VGAM1766 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24690] Nucleotide sequences of the VGAM1766 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1766 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1766 are further described hereinbelow with reference to Table 1.

[24691] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1766 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24692] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1767 (VGAM1767) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24693] VGAM1767 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1767 was detected is described hereinabove with reference to Figs. 2-8.

[24694] VGAM1767 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM1767 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24695] VGAM1767 gene, herein designated VGAM GENE, encodes a VGAM1767 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1767 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1767 precursor RNA is designated SEQ ID:1753, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1753 is located at position 1407 relative to the genome of Rabbit fibroma virus.

[24696] VGAM1767 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24697] An enzyme complex designated DICER COMPLEX, dices the VGAM1767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1767 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1767 RNA is designated SEQ ID:4478, and is provided hereinbelow with reference to the sequence listing part.

[24698] VGAM1767 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[24699] VGAM1767 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1767 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24700] The complementary binding of VGAM1767 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1767 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24701] It is appreciated that VGAM1767 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1767 host target genes. The mRNA of each one of this plurality of VGAM1767 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1767 RNA, herein designated VGAM RNA, and which when bound by VGAM1767 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1767 host target proteins.

[24702] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1767 gene, herein designated VGAM GENE, on one

or more VGAM1767 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24703] It is yet further appreciated that a function of VGAM1767 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM1767 correlate with, and may be deduced from, the identity of the host target genes which VGAM1767 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24704] Nucleotide sequences of the VGAM1767 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1767 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1767 are further described hereinbelow with reference to Table 1.

[24705] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1767 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24706] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1768 (VGAM1768) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24707] VGAM1768 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1768 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[24708] VGAM1768 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM1768 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24709] VGAM1768 gene, herein designated VGAM GENE, encodes a VGAM1768 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1768 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1768 precursor RNA is designated SEQ ID:1754, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1754 is located at position 431 relative to the genome of Rabbit fibroma virus.

[24710] VGAM1768 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24711] An enzyme complex designated DICER COMPLEX, dices the VGAM1768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1768 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1768 RNA is designated SEQ ID:4479, and is provided hereinbelow with reference to the sequence listing part.

[24712] VGAM1768 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24713] VGAM1768 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1768 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1768 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[24714] The complementary binding of VGAM1768 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1768 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24715] It is appreciated that VGAM1768 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1768 host target genes. The mRNA of each one of this plurality of VGAM1768 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1768 RNA, herein designated VGAM RNA, and which when bound by VGAM1768 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1768 host target proteins.

[24716] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1768 gene, herein designated VGAM GENE, on one or more VGAM1768 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24717] It is yet further appreciated that a function of VGAM1768 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1768 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM1768 correlate with, and may be deduced from, the identity of the host target genes which VGAM1768 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[24718] Nucleotide sequences of the VGAM1768 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1768 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1768 are further described hereinbelow with reference to Table 1.

[24719] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1768 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24720] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1769 (VGAM1769) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24721] VGAM1769 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1769 was detected is described hereinabove with reference to Figs. 2-8.

[24722] VGAM1769 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM1769 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24723] VGAM1769 gene, herein designated VGAM GENE, encodes a VGAM1769 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1769 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1769 precursor RNA is designated SEQ ID:1755, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1755 is located at position 123 relative to the genome of Rabbit fibroma virus.

[24724] VGAM1769 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24725] An enzyme complex designated DICER COMPLEX, dices the VGAM1769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1769 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1769 RNA is designated SEQ ID:4480, and is provided hereinbelow with reference to the sequence listing part.

[24726] VGAM1769 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24727] VGAM1769 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1769 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24728] The complementary binding of VGAM1769 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1769 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24729] It is appreciated that VGAM1769 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1769 host target genes. The mRNA of each one of this plurality of VGAM1769 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1769 RNA, herein designated VGAM RNA, and which when bound by VGAM1769 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1769 host target proteins.

[24730] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1769 gene, herein designated VGAM GENE, on one or more VGAM1769 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24731] It is yet further appreciated that a function of VGAM1769 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM1769 correlate with, and may be deduced from, the identity of the host target genes which VGAM1769 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[24732] Nucleotide sequences of the VGAM1769 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1769 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1769 are further described hereinbelow with reference to Table 1.

[24733] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1769 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24734] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1770 (VGAM1770) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24735] VGAM1770 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1770 was detected is described hereinabove with reference to Figs. 2-8.

[24736] VGAM1770 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM1770 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24737] VGAM1770 gene, herein designated VGAM GENE, encodes a VGAM1770 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1770 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1770 precursor RNA is designated SEQ ID:1756, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1756 is located at position 8292 relative to the genome of Rabbit fibroma virus.

[24738] VGAM1770 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24739] An enzyme complex designated DICER COMPLEX, dices the VGAM1770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1770 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1770 RNA is designated SEQ ID:4481, and is provided hereinbelow with reference to the sequence listing part.

[24740] VGAM1770 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24741] VGAM1770 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1770 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24742] The complementary binding of VGAM1770 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1770 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24743] It is appreciated that VGAM1770 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1770 host target genes. The mRNA of each one of this plurality of VGAM1770 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1770 RNA, herein designated VGAM RNA, and which when bound by VGAM1770 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1770 host target proteins.

[24744] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1770 gene, herein designated VGAM GENE, on one or more VGAM1770 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24745] It is yet further appreciated that a function of VGAM1770 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM1770 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1770 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24746] Nucleotide sequences of the VGAM1770 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1770 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1770 are further described hereinbelow with reference to Table 1.

[24747] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1770 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24748] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1771 (VGAM1771) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24749] VGAM1771 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1771 was detected is described hereinabove with reference to Figs. 2-8.

[24750] VGAM1771 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus type 1. VGAM1771 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24751] VGAM1771 gene, herein designated VGAM GENE, encodes a VGAM1771 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1771 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1771 precursor RNA is designated SEQ ID:1757, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1757 is located at position 3477 relative to the genome of pestivirus type 1.

[24752] VGAM1771 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1771 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24753] An enzyme complex designated DICER COMPLEX, dices the VGAM1771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1771 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1771 RNA is designated SEQ ID:4482, and is provided hereinbelow with reference to the sequence listing part.

[24754] VGAM1771 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1771 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24755] VGAM1771 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1771 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24756] The complementary binding of VGAM1771 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1771 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24757] It is appreciated that VGAM1771 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1771 host target genes. The mRNA of each one of this plurality of VGAM1771 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1771 RNA, herein designated VGAM RNA, and which when bound by VGAM1771 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1771 host target proteins.

[24758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1771 gene, herein designated VGAM GENE, on one or more VGAM1771 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24759] It is yet further appreciated that a function of VGAM1771 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of viral infection by pestivirus type 1. Specific functions, and accordingly utilities, of VGAM1771 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1771 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24760] Nucleotide sequences of the VGAM1771 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1771 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1771 are further described hereinbelow with reference to Table 1.

[24761] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1771 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24762] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1772 (VGAM1772) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[24763] VGAM1772 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1772 was detected is described hereinabove with reference to Figs. 2-8.

[24764] VGAM1772 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus type 1. VGAM1772 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24765] VGAM1772 gene, herein designated VGAM GENE, encodes a VGAM1772 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1772 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1772 precursor RNA is designated SEQ ID:1758, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1758 is located at position 2037 relative to the genome of pestivirus type 1.

[24766] VGAM1772 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1772 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24767] An enzyme complex designated DICER COMPLEX, dices the VGAM1772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1772 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1772 RNA is designated SEQ ID:4483, and is provided hereinbelow with reference to the sequence listing part.

[24768] VGAM1772 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1772 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24769] VGAM1772 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1772 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1772 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24770] The complementary binding of VGAM1772 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1772 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24771] It is appreciated that VGAM1772 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1772 host target genes. The mRNA of each one of this plurality of VGAM1772 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1772 RNA, herein designated VGAM RNA, and which when bound by VGAM1772 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1772 host target proteins.

[24772] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1772 gene, herein designated VGAM GENE, on one or more VGAM1772 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24773] It is yet further appreciated that a function of VGAM1772 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1772 include diagnosis, prevention and treatment of viral infection by pestivirus type 1. Specific

functions, and accordingly utilities, of VGAM1772 correlate with, and may be deduced from, the identity of the host target genes which VGAM1772 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24774] Nucleotide sequences of the VGAM1772 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1772 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1772 are further described hereinbelow with reference to Table 1.

[24775] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1772 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24776] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1773 (VGAM1773) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[24777] VGAM1773 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1773 was detected is described hereinabove with reference to Figs. 2-8.

[24778] VGAM1773 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1773 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24779] VGAM1773 gene, herein designated VGAM GENE, encodes a VGAM1773 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1773 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1773 precursor RNA is designated SEQ ID:1759, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1759 is located at position 6368 relative to the genome of Cryphonectria hypovirus 1.

[24780] VGAM1773 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24781] An enzyme complex designated DICER COMPLEX, dices the VGAM1773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1773 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1773 RNA is designated SEQ ID:4484, and is provided hereinbelow with reference to the sequence listing part.

[24782] VGAM1773 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24783] VGAM1773 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1773 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1773 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1773 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24784] The complementary binding of VGAM1773 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1773 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24785] It is appreciated that VGAM1773 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1773 host target genes. The mRNA of each one of this plurality of VGAM1773 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1773 RNA, herein designated VGAM RNA, and which when bound by VGAM1773 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1773 host target proteins.

[24786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1773 gene, herein designated VGAM GENE, on one or more VGAM1773 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24787] It is yet further appreciated that a function of VGAM1773 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1773 include diagnosis, prevention and

treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1773 correlate with, and may be deduced from, the identity of the host target genes which VGAM1773 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24788] Nucleotide sequences of the VGAM1773 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1773 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1773 are further described hereinbelow with reference to Table 1.

[24789] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1773 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24790] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1774 (VGAM1774) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24791] VGAM1774 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1774 was detected is described hereinabove with reference to Figs. 2-8.

[24792] VGAM1774 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1774 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24793] VGAM1774 gene, herein designated VGAM GENE, encodes a VGAM1774 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1774 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1774 precursor RNA is designated SEQ ID:1760, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1760 is located at position 10666 relative to the genome of Cryphonectria hypovirus

1.

[24794] VGAM1774 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24795] An enzyme complex designated DICER COMPLEX, dices the VGAM1774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1774 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1774 RNA is designated SEQ ID:4485, and is provided hereinbelow with reference to the sequence listing part.

[24796] VGAM1774 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24797] VGAM1774 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1774 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24798] The complementary binding of VGAM1774 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1774 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24799] It is appreciated that VGAM1774 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1774 host target genes. The mRNA of each one of this plurality of VGAM1774 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1774 RNA, herein designated VGAM RNA, and which when bound by VGAM1774 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1774 host target proteins.

[24800] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1774 gene, herein designated VGAM GENE, on one or more VGAM1774 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24801] It is yet further appreciated that a function of VGAM1774 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1774 correlate with, and may be deduced from, the identity of the host target genes which VGAM1774 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24802] Nucleotide sequences of the VGAM1774 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1774 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1774 are further described hereinbelow with reference to Table 1.

[24803] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1774 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24804] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1775 (VGAM1775) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24805] VGAM1775 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1775 was detected is described hereinabove with reference to Figs. 2-8.

[24806] VGAM1775 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1775 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24807] VGAM1775 gene, herein designated VGAM GENE, encodes a VGAM1775 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1775 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1775 precursor RNA is designated SEQ ID:1761, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1761 is located at position 994 relative to the genome of Cryphonectria hypovirus 1.

[24808] VGAM1775 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24809] An enzyme complex designated DICER COMPLEX, dices the VGAM1775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1775 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM1775 RNA is designated SEQ ID:4486, and is provided hereinbelow with reference to the sequence

listing part.

[24810] VGAM1775 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24811] VGAM1775 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1775 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24812] The complementary binding of VGAM1775 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1775 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24813] It is appreciated that VGAM1775 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1775 host target genes. The mRNA of each one of this plurality of VGAM1775 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1775 RNA, herein designated VGAM RNA, and which when bound by VGAM1775 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1775 host target proteins.

[24814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1775 gene, herein designated VGAM GENE, on one or more VGAM1775 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24815] It is yet further appreciated that a function of VGAM1775

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1775 correlate with, and may be deduced from, the identity of the host target genes which VGAM1775 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24816] Nucleotide sequences of the VGAM1775 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1775 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1775 are further described hereinbelow with reference to Table 1.

[24817] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1775 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24818] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1776 (VGAM1776) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24819] VGAM1776 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1776 was detected is described hereinabove with reference to Figs. 2-8.

[24820] VGAM1776 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1776 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24821] VGAM1776 gene, herein designated VGAM GENE, encodes a VGAM1776 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1776 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1776 precursor RNA is designated SEQ ID:1762, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1762 is located at position 9833 relative to the genome of Cryphonectria hypovirus 1.

[24822] VGAM1776 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24823] An enzyme complex designated DICER COMPLEX, dices the VGAM1776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1776 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1776 RNA is designated SEQ ID:4487, and

is provided hereinbelow with reference to the sequence listing part.

[24824] VGAM1776 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24825] VGAM1776 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1776 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1776 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24826] The complementary binding of VGAM1776 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1776 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24827] It is appreciated that VGAM1776 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1776 host target genes. The mRNA of each one of this plurality of VGAM1776 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1776 RNA, herein designated VGAM RNA, and which when bound by VGAM1776 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1776 host target proteins.

[24828] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1776 gene, herein designated VGAM GENE, on one or more VGAM1776 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24829] It is yet further appreciated that a function of VGAM1776 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1776 correlate with, and may be deduced from, the identity of the host target genes which VGAM1776 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24830] Nucleotide sequences of the VGAM1776 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1776 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1776 are further described hereinbelow with reference to Table 1.

[24831] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1776 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24832] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1777 (VGAM1777) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24833] VGAM1777 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1777 was detected is described hereinabove with reference to Figs. 2-8.

[24834] VGAM1777 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1777 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24835] VGAM1777 gene, herein designated VGAM GENE, encodes a VGAM1777 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1777 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1777 precur-

sor RNA is designated SEQ ID:1763, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1763 is located at position 7246 relative to the genome of Cryphonectria hypovirus 1.

[24836] VGAM1777 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24837] An enzyme complex designated DICER COMPLEX, dices the VGAM1777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1777 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM1777 RNA is designated SEQ ID:4488, and is provided hereinbelow with reference to the sequence listing part.

[24838] VGAM1777 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24839] VGAM1777 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1777 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24840] The complementary binding of VGAM1777 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1777 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24841] It is appreciated that VGAM1777 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1777 host target genes. The mRNA of

each one of this plurality of VGAM1777 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1777 RNA, herein designated VGAM RNA, and which when bound by VGAM1777 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1777 host target proteins.

[24842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1777 gene, herein designated VGAM GENE, on one or more VGAM1777 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[24843] It is yet further appreciated that a function of VGAM1777 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1777 correlate with, and may be deduced from, the identity of the host target genes which VGAM1777 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24844] Nucleotide sequences of the VGAM1777 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1777 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1777 are further described hereinbelow with reference to Table 1.

[24845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1777 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[24846] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1778 (VGAM1778) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24847] VGAM1778 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1778 was detected is described hereinabove with reference to Figs. 2-8.

[24848] VGAM1778 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1778 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24849] VGAM1778 gene, herein designated VGAM GENE, encodes a VGAM1778 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1778 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1778 precursor RNA is designated SEQ ID:1764, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1764 is located at position 3023 relative to the genome of Cryphonectria hypovirus 1.

[24850] VGAM1778 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24851] An enzyme complex designated DICER COMPLEX, dices the VGAM1778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1778 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1778 RNA is designated SEQ ID:4489, and is provided hereinbelow with reference to the sequence listing part.

[24852] VGAM1778 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24853] VGAM1778 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1778 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24854] The complementary binding of VGAM1778 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1778 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24855] It is appreciated that VGAM1778 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1778 host target genes. The mRNA of each one of this plurality of VGAM1778 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1778 RNA, herein designated VGAM RNA, and which when bound by VGAM1778 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1778 host target proteins.

[24856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1778 gene, herein designated VGAM GENE, on one or more VGAM1778 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24857] It is yet further appreciated that a function of VGAM1778 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1778 correlate with, and may be deduced from, the identity of the host target genes which VGAM1778 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24858] Nucleotide sequences of the VGAM1778 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1778 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1778 are further described hereinbelow with reference to Table 1.

[24859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1778 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24860] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1779 (VGAM1779) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24861] VGAM1779 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1779 was detected is described hereinabove with reference to Figs. 2-8.

[24862] VGAM1779 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1779 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24863] VGAM1779 gene, herein designated VGAM GENE, encodes a VGAM1779 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1779 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1779 precursor RNA is designated SEQ ID:1765, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1765 is located at position 4059 relative to the genome of Cryphonectria hypovirus 1.

[24864] VGAM1779 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24865] An enzyme complex designated DICER COMPLEX, dices the VGAM1779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1779 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1779 RNA is designated SEQ ID:4490, and is provided hereinbelow with reference to the sequence listing part.

[24866] VGAM1779 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24867] VGAM1779 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1779 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1779 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24868] The complementary binding of VGAM1779 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1779 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24869] It is appreciated that VGAM1779 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1779 host target genes. The mRNA of each one of this plurality of VGAM1779 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1779 RNA, herein designated VGAM RNA, and which when bound by VGAM1779 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1779 host target proteins.

[24870] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1779 gene, herein designated VGAM GENE, on one or more VGAM1779 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24871] It is yet further appreciated that a function of VGAM1779 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1779 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1779 correlate with, and may be deduced from, the identity of the host target genes which VGAM1779 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24872] Nucleotide sequences of the VGAM1779 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1779 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1779 are further described hereinbelow with reference to Table 1.

[24873] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1779 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24874] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1780 (VGAM1780) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24875] VGAM1780 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1780 was detected is described hereinabove with reference to Figs. 2-8.

[24876] VGAM1780 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1780 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24877] VGAM1780 gene, herein designated VGAM GENE, encodes a VGAM1780 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1780 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1780 precursor RNA is designated SEQ ID:1766, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1766 is located at position 6807 relative to the genome of Cryphonectria hypovirus 1.

[24878] VGAM1780 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24879] An enzyme complex designated DICER COMPLEX, dices the VGAM1780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1780 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1780 RNA is designated SEQ ID:4491, and is provided hereinbelow with reference to the sequence listing part.

[24880] VGAM1780 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24881] VGAM1780 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1780 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1780 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24882] The complementary binding of VGAM1780 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1780 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24883] It is appreciated that VGAM1780 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1780 host target genes. The mRNA of each one of this plurality of VGAM1780 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1780 RNA, herein designated VGAM RNA, and which when bound by VGAM1780 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1780 host target proteins.

[24884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1780 gene, herein designated VGAM GENE, on one or more VGAM1780 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24885] It is yet further appreciated that a function of VGAM1780 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1780 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1780 correlate with, and may be deduced from, the identity of the host target genes which VGAM1780 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24886] Nucleotide sequences of the VGAM1780 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1780 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1780 are further described hereinbelow with reference to Table 1.

[24887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1780 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24888] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1781 (VGAM1781) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24889] VGAM1781 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1781 was detected is described hereinabove with reference to Figs. 2-8.

[24890] VGAM1781 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1781 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24891] VGAM1781 gene, herein designated VGAM GENE, encodes a VGAM1781 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1781 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1781 precursor RNA is designated SEQ ID:1767, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1767 is located at position 9633 relative to the genome of Cryphonectria hypovirus 1.

[24892] VGAM1781 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24893] An enzyme complex designated DICER COMPLEX, dices the VGAM1781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1781 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1781 RNA is designated SEQ ID:4492, and is provided hereinbelow with reference to the sequence listing part.

[24894] VGAM1781 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24895] VGAM1781 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1781 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24896] The complementary binding of VGAM1781 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1781 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[24897] It is appreciated that VGAM1781 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1781 host target genes. The mRNA of each one of this plurality of VGAM1781 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1781 RNA, herein designated VGAM RNA, and which when bound by VGAM1781 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1781 host target proteins.

[24898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1781 gene, herein designated VGAM GENE, on one or more VGAM1781 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24899] It is yet further appreciated that a function of VGAM1781 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1781 correlate with, and may be deduced from, the identity of the host target genes which VGAM1781 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24900] Nucleotide sequences of the VGAM1781 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1781 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1781 are further described hereinbelow with reference to Table 1.

[24901] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1781 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24902] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1782 (VGAM1782) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24903] VGAM1782 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1782 was detected is described hereinabove with reference to Figs. 2-8.

[24904] VGAM1782 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM1782 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24905] VGAM1782 gene, herein designated VGAM GENE, encodes a VGAM1782 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1782 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1782 precursor RNA is designated SEQ ID:1768, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1768 is located at position 9154 relative to the genome of Cryphonectria hypovirus 1.

[24906] VGAM1782 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24907] An enzyme complex designated DICER COMPLEX, dices the VGAM1782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1782 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1782 RNA is designated SEQ ID:4493, and is provided hereinbelow with reference to the sequence listing part.

[24908] VGAM1782 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24909] VGAM1782 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1782 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1782 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24910] The complementary binding of VGAM1782 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1782 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24911] It is appreciated that VGAM1782 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1782 host target genes. The mRNA of each one of this plurality of VGAM1782 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1782 RNA, herein designated VGAM RNA, and which when bound by VGAM1782 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1782 host target proteins.

[24912] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1782 gene, herein designated VGAM GENE, on one or more VGAM1782 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24913] It is yet further appreciated that a function of VGAM1782 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM1782 correlate with, and may be deduced from, the identity of the host target genes which VGAM1782 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24914] Nucleotide sequences of the VGAM1782 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1782 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1782 are further described hereinbelow with reference to Table 1.

[24915] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1782 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24916] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1783 (VGAM1783) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24917] VGAM1783 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1783 was detected is described hereinabove with reference to Figs. 2-8.

[24918] VGAM1783 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM1783 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24919] VGAM1783 gene, herein designated VGAM GENE, encodes

a VGAM1783 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1783 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1783 precursor RNA is designated SEQ ID:1769, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1769 is located at position 33506 relative to the genome of Fowlpox virus.

[24920] VGAM1783 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24921] An enzyme complex designated DICER COMPLEX, dices the VGAM1783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1783 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1783 RNA is designated SEQ ID:4494, and is provided hereinbelow with reference to the sequence listing part.

[24922] VGAM1783 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24923] VGAM1783 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1783 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1783 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24924] The complementary binding of VGAM1783 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1783 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1783 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24925] It is appreciated that VGAM1783 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1783 host target genes. The mRNA of each one of this plurality of VGAM1783 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1783 RNA, herein designated VGAM RNA, and which when bound by VGAM1783 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1783 host target proteins.

[24926] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1783 gene, herein designated VGAM GENE, on one or more VGAM1783 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24927] It is yet further appreciated that a function of VGAM1783 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1783 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1783 correlate with, and may be deduced from, the identity of the host target genes which VGAM1783 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24928] Nucleotide sequences of the VGAM1783 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1783 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1783 are further

described hereinbelow with reference to Table 1.

[24929] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1783 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24930] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1784 (VGAM1784) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24931] VGAM1784 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1784 was detected is described hereinabove with reference to Figs. 2-8.

[24932] VGAM1784 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1784 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24933] VGAM1784 gene, herein designated VGAM GENE, encodes a VGAM1784 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1784 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1784 precursor RNA is designated SEQ ID:1770, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1770 is located at position 43278 relative to the genome of Fowlpox virus.

[24934] VGAM1784 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24935] An enzyme complex designated DICER COMPLEX, dices the VGAM1784 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1784 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1784 RNA is designated SEQ ID:4495, and is provided hereinbelow with reference to the sequence listing part.

[24936] VGAM1784 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24937] VGAM1784 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1784 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1784 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24938] The complementary binding of VGAM1784 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1784

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1784 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24939] It is appreciated that VGAM1784 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1784 host target genes. The mRNA of each one of this plurality of VGAM1784 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1784 RNA, herein designated VGAM RNA, and which when bound by VGAM1784 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1784 host target proteins.

[24940] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1784 gene, herein designated VGAM GENE, on one or more VGAM1784 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24941] It is yet further appreciated that a function of VGAM1784 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1784 correlate with, and may be deduced from, the identity of the host target genes which VGAM1784 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24942] Nucleotide sequences of the VGAM1784 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1784 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1784 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1784 are further described hereinbelow with reference to Table 1.

[24943] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1784 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24944] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1785 (VGAM1785) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24945] VGAM1785 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1785 was detected is described hereinabove with reference to Figs. 2-8.

[24946] VGAM1785 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM1785 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[24947] VGAM1785 gene, herein designated VGAM GENE, encodes a VGAM1785 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1785 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1785 precursor RNA is designated SEQ ID:1771, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1771 is located at position 36138 relative to the genome of Fowlpox virus.

[24948] VGAM1785 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24949] An enzyme complex designated DICER COMPLEX, dices

the VGAM1785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1785 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1785 RNA is designated SEQ ID:4496, and is provided hereinbelow with reference to the sequence listing part.

[24950] VGAM1785 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1785 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1785 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24951] VGAM1785 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1785 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1785 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1785 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1785 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24952] The complementary binding of VGAM1785 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1785 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1785 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1785 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24953] It is appreciated that VGAM1785 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1785 host target genes. The mRNA of each one of this plurality of VGAM1785 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1785 RNA, herein designated VGAM RNA, and which when bound by VGAM1785 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1785 host target proteins.

[24954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1785 gene, herein designated VGAM GENE, on one or more VGAM1785 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24955] It is yet further appreciated that a function of VGAM1785 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1785 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1785 correlate with, and may be deduced from, the identity of the host target genes which VGAM1785 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24956] Nucleotide sequences of the VGAM1785 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1785 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1785 are further described hereinbelow with reference to Table 1.

[24957] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1785 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24958] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1786 (VGAM1786) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24959] VGAM1786 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1786 was detected is described hereinabove with reference to Figs. 2-8.

[24960] VGAM1786 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1786 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[24961] VGAM1786 gene, herein designated VGAM GENE, encodes a VGAM1786 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1786 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1786 precursor RNA is designated SEQ ID:1772, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1772 is located at position 36018 relative to the genome of Fowlpox virus.

[24962] VGAM1786 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24963] An enzyme complex designated DICER COMPLEX, dices the VGAM1786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1786 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1786 RNA is designated SEQ ID:4497, and is provided hereinbelow with reference to the sequence listing part.

[24964] VGAM1786 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24965] VGAM1786 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1786 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1786 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24966] The complementary binding of VGAM1786 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1786 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1786 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24967] It is appreciated that VGAM1786 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1786 host target genes. The mRNA of each one of this plurality of VGAM1786 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1786 RNA, herein designated VGAM RNA, and which when bound by VGAM1786 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1786 host target proteins.

[24968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1786 gene, herein designated VGAM GENE, on one or more VGAM1786 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24969] It is yet further appreciated that a function of VGAM1786 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1786 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1786 correlate with, and may be deduced from, the identity of the host target genes which VGAM1786 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24970] Nucleotide sequences of the VGAM1786 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1786 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1786 are further described hereinbelow with reference to Table 1.

[24971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1786 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24972] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1787 (VGAM1787) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24973] VGAM1787 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1787 was detected is described hereinabove with reference to Figs. 2-8.

[24974] VGAM1787 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM1787 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24975] VGAM1787 gene, herein designated VGAM GENE, encodes a VGAM1787 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1787 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1787 precursor RNA is designated SEQ ID:1773, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1773 is located at position 44889 relative to the genome of Fowlpox virus.

[24976] VGAM1787 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[24977] An enzyme complex designated DICER COMPLEX, dices the VGAM1787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1787 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1787 RNA is designated SEQ ID:4498, and is provided hereinbelow with reference to the sequence listing part.

[24978] VGAM1787 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24979] VGAM1787 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1787 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1787 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24980] The complementary binding of VGAM1787 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1787 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24981] It is appreciated that VGAM1787 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1787 host target genes. The mRNA of each one of this plurality of VGAM1787 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1787 RNA, herein designated VGAM RNA, and which when bound by VGAM1787 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1787 host target proteins.

[24982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1787 gene, herein designated VGAM GENE, on one or more VGAM1787 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24983] It is yet further appreciated that a function of VGAM1787 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1787 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1787 correlate with, and may be deduced from, the identity of the host target genes which VGAM1787 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24984] Nucleotide sequences of the VGAM1787 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1787 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1787 are further described hereinbelow with reference to Table 1.

[24985] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1787 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24986] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1788 (VGAM1788) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24987] VGAM1788 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1788 was detected is described hereinabove with reference to Figs. 2-8.

[24988] VGAM1788 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Fowlpox virus. VGAM1788 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24989] VGAM1788 gene, herein designated VGAM GENE, encodes a VGAM1788 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1788 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1788 precursor RNA is designated SEQ ID:1774, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1774 is located at position 45071 relative to the genome of Fowlpox virus.

[24990] VGAM1788 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24991] An enzyme complex designated DICER COMPLEX, dices the VGAM1788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1788 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1788 RNA is designated SEQ ID:4499, and is provided hereinbelow with reference to the sequence listing part.

[24992] VGAM1788 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24993] VGAM1788 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1788 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1788 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24994] The complementary binding of VGAM1788 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1788 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24995] It is appreciated that VGAM1788 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1788 host target genes. The mRNA of each one of this plurality of VGAM1788 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1788 RNA, herein designated VGAM RNA, and which when bound by VGAM1788 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1788 host target proteins.

[24996] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1788 gene, herein designated VGAM GENE, on one or more VGAM1788 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24997] It is yet further appreciated that a function of VGAM1788 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1788 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1788 correlate with, and may be deduced from, the identity of the host target genes which VGAM1788 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24998] Nucleotide sequences of the VGAM1788 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1788 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1788 are further described hereinbelow with reference to Table 1.

[24999] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1788 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25000] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1789 (VGAM1789) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25001] VGAM1789 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1789 was detected is described hereinabove with reference to Figs. 2-8.

[25002] VGAM1789 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1789 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25003] VGAM1789 gene, herein designated VGAM GENE, encodes a VGAM1789 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1789 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1789 precursor RNA is designated SEQ ID:1775, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1775 is located at position 42299 relative to the genome of Fowlpox virus.

[25004] VGAM1789 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25005] An enzyme complex designated DICER COMPLEX, dices the VGAM1789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1789 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1789 RNA is designated SEQ ID:4500, and is provided hereinbelow with reference to the sequence listing part.

[25006] VGAM1789 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[25007] VGAM1789 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1789 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1789 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25008] The complementary binding of VGAM1789 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1789 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25009] It is appreciated that VGAM1789 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1789 host target genes. The mRNA of each one of this plurality of VGAM1789 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1789 RNA, herein designated VGAM RNA, and which when bound by VGAM1789 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1789 host target proteins.

[25010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1789 gene, herein designated VGAM GENE, on one

or more VGAM1789 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25011] It is yet further appreciated that a function of VGAM1789 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1789 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1789 correlate with, and may be deduced from, the identity of the host target genes which VGAM1789 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25012] Nucleotide sequences of the VGAM1789 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1789 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1789 are further described hereinbelow with reference to Table 1.

[25013] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1789 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25014] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1790 (VGAM1790) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25015] VGAM1790 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1790 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[25016] VGAM1790 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1790 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25017] VGAM1790 gene, herein designated VGAM GENE, encodes a VGAM1790 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1790 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1790 precursor RNA is designated SEQ ID:1776, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1776 is located at position 79077 relative to the genome of Rana tigrina ranavirus.

[25018] VGAM1790 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25019] An enzyme complex designated DICER COMPLEX, dices the VGAM1790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1790 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1790 RNA is designated SEQ ID:4501, and is provided hereinbelow with reference to the sequence listing part.

[25020] VGAM1790 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25021] VGAM1790 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1790 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1790 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[25022] The complementary binding of VGAM1790 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1790 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25023] It is appreciated that VGAM1790 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1790 host target genes. The mRNA of each one of this plurality of VGAM1790 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1790 RNA, herein designated VGAM RNA, and which when bound by VGAM1790 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1790 host target proteins.

[25024] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1790 gene, herein designated VGAM GENE, on one or more VGAM1790 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25025] It is yet further appreciated that a function of VGAM1790 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1790 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1790 correlate with, and may be deduced from, the identity of the host target genes which VGAM1790 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[25026] Nucleotide sequences of the VGAM1790 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1790 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1790 are further described hereinbelow with reference to Table 1.

[25027] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1790 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25028] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1791 (VGAM1791) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25029] VGAM1791 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1791 was detected is described hereinabove with reference to Figs. 2-8.

[25030] VGAM1791 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1791 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25031] VGAM1791 gene, herein designated VGAM GENE, encodes a VGAM1791 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1791 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1791 precursor RNA is designated SEQ ID:1777, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1777 is located at position 85010 relative to the genome of Rana tigrina ranavirus.

[25032] VGAM1791 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25033] An enzyme complex designated DICER COMPLEX, dices the VGAM1791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1791 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1791 RNA is designated SEQ ID:4502, and is provided hereinbelow with reference to the sequence listing part.

[25034] VGAM1791 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25035] VGAM1791 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1791 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25036] The complementary binding of VGAM1791 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1791 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25037] It is appreciated that VGAM1791 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1791 host target genes. The mRNA of each one of this plurality of VGAM1791 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1791 RNA, herein designated VGAM RNA, and which when bound by VGAM1791 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1791 host target proteins.

[25038] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1791 gene, herein designated VGAM GENE, on one or more VGAM1791 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25039] It is yet further appreciated that a function of VGAM1791 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1791 correlate with, and may be deduced from, the identity of the host target genes which VGAM1791 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[25040] Nucleotide sequences of the VGAM1791 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1791 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1791 are further described hereinbelow with reference to Table 1.

[25041] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1791 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25042] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1792 (VGAM1792) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25043] VGAM1792 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1792 was detected is described hereinabove with reference to Figs. 2-8.

[25044] VGAM1792 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1792 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25045] VGAM1792 gene, herein designated VGAM GENE, encodes a VGAM1792 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1792 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1792 precursor RNA is designated SEQ ID:1778, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1778 is located at position 75405 relative to the genome of Rana tigrina ranavirus.

[25046] VGAM1792 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25047] An enzyme complex designated DICER COMPLEX, dices the VGAM1792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1792 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1792 RNA is designated SEQ ID:4503, and is provided hereinbelow with reference to the sequence listing part.

[25048] VGAM1792 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25049] VGAM1792 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1792 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1792 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25050] The complementary binding of VGAM1792 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1792 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25051] It is appreciated that VGAM1792 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1792 host target genes. The mRNA of each one of this plurality of VGAM1792 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1792 RNA, herein designated VGAM RNA, and which when bound by VGAM1792 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1792 host target proteins.

[25052] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1792 gene, herein designated VGAM GENE, on one or more VGAM1792 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25053] It is yet further appreciated that a function of VGAM1792 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1792 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1792 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1792 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25054] Nucleotide sequences of the VGAM1792 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1792 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1792 are further described hereinbelow with reference to Table 1.

[25055] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1792 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25056] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1793 (VGAM1793) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25057] VGAM1793 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1793 was detected is described hereinabove with reference to Figs. 2-8.

[25058] VGAM1793 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1793 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25059] VGAM1793 gene, herein designated VGAM GENE, encodes a VGAM1793 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1793 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1793 precursor RNA is designated SEQ ID:1779, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1779 is located at position 85120 relative to the genome of Rana tigrina ranavirus.

[25060] VGAM1793 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1793 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25061] An enzyme complex designated DICER COMPLEX, dices the VGAM1793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1793 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1793 RNA is designated SEQ ID:4504, and is provided hereinbelow with reference to the sequence listing part.

[25062] VGAM1793 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1793 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25063] VGAM1793 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1793 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25064] The complementary binding of VGAM1793 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1793 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25065] It is appreciated that VGAM1793 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1793 host target genes. The mRNA of each one of this plurality of VGAM1793 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1793 RNA, herein designated VGAM RNA, and which when bound by VGAM1793 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1793 host target proteins.

[25066] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1793 gene, herein designated VGAM GENE, on one or more VGAM1793 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25067] It is yet further appreciated that a function of VGAM1793 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1793

correlate with, and may be deduced from, the identity of the host target genes which VGAM1793 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25068] Nucleotide sequences of the VGAM1793 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1793 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1793 are further described hereinbelow with reference to Table 1.

[25069] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1793 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25070] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1794 (VGAM1794) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[25071] VGAM1794 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1794 was detected is described hereinabove with reference to Figs. 2-8.

[25072] VGAM1794 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1794 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25073] VGAM1794 gene, herein designated VGAM GENE, encodes a VGAM1794 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1794 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1794 precursor RNA is designated SEQ ID:1780, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1780 is located at position 84588 relative to the genome of Rana tigrina ranavirus.

[25074] VGAM1794 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1794 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25075] An enzyme complex designated DICER COMPLEX, dices the VGAM1794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1794 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1794 RNA is designated SEQ ID:4505, and is provided hereinbelow with reference to the sequence listing part.

[25076] VGAM1794 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1794 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25077] VGAM1794 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1794 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25078] The complementary binding of VGAM1794 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1794 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25079] It is appreciated that VGAM1794 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1794 host target genes. The mRNA of each one of this plurality of VGAM1794 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1794 RNA, herein designated VGAM RNA, and which when bound by VGAM1794 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1794 host target proteins.

[25080] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1794 gene, herein designated VGAM GENE, on one or more VGAM1794 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25081] It is yet further appreciated that a function of VGAM1794 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Spe-

cific functions, and accordingly utilities, of VGAM1794 correlate with, and may be deduced from, the identity of the host target genes which VGAM1794 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25082] Nucleotide sequences of the VGAM1794 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1794 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1794 are further described hereinbelow with reference to Table 1.

[25083] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1794 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25084] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1795 (VGAM1795) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[25085] VGAM1795 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1795 was detected is described hereinabove with reference to Figs. 2-8.

[25086] VGAM1795 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1795 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25087] VGAM1795 gene, herein designated VGAM GENE, encodes a VGAM1795 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1795 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1795 precursor RNA is designated SEQ ID:1781, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1781 is located at position 85710 relative to the genome of Rana tigrina ranavirus.

[25088] VGAM1795 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25089] An enzyme complex designated DICER COMPLEX, dices the VGAM1795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1795 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1795 RNA is designated SEQ ID:4506, and is provided hereinbelow with reference to the sequence listing part.

[25090] VGAM1795 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25091] VGAM1795 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1795 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1795 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1795 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25092] The complementary binding of VGAM1795 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1795 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25093] It is appreciated that VGAM1795 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1795 host target genes. The mRNA of each one of this plurality of VGAM1795 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1795 RNA, herein designated VGAM RNA, and which when bound by VGAM1795 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1795 host target proteins.

[25094] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1795 gene, herein designated VGAM GENE, on one or more VGAM1795 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25095] It is yet further appreciated that a function of VGAM1795 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1795 include diagnosis, prevention and

treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1795 correlate with, and may be deduced from, the identity of the host target genes which VGAM1795 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25096] Nucleotide sequences of the VGAM1795 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1795 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1795 are further described hereinbelow with reference to Table 1.

[25097] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1795 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25098] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1796 (VGAM1796) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25099] VGAM1796 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1796 was detected is described hereinabove with reference to Figs. 2-8.

[25100] VGAM1796 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1796 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25101] VGAM1796 gene, herein designated VGAM GENE, encodes a VGAM1796 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1796 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1796 precursor RNA is designated SEQ ID:1782, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1782 is located at position 79650 relative to the genome of Rana tigrina ranavirus.

[25102] VGAM1796 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25103] An enzyme complex designated DICER COMPLEX, dices the VGAM1796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1796 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1796 RNA is designated SEQ ID:4507, and is provided hereinbelow with reference to the sequence listing part.

[25104] VGAM1796 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25105] VGAM1796 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1796 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1796 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25106] The complementary binding of VGAM1796 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1796 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25107] It is appreciated that VGAM1796 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1796 host target genes. The mRNA of each one of this plurality of VGAM1796 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1796 RNA, herein designated VGAM

RNA, and which when bound by VGAM1796 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1796 host target proteins.

[25108] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1796 gene, herein designated VGAM GENE, on one or more VGAM1796 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25109] It is yet further appreciated that a function of VGAM1796 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1796 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1796 correlate with, and may be deduced from, the identity of the host target genes which VGAM1796 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25110] Nucleotide sequences of the VGAM1796 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1796 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1796 are further described hereinbelow with reference to Table 1.

[25111] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1796 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25112] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1797 (VGAM1797) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25113] VGAM1797 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1797 was detected is described hereinabove with reference to Figs. 2-8.

[25114] VGAM1797 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1797 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25115] VGAM1797 gene, herein designated VGAM GENE, encodes a VGAM1797 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1797 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1797 precursor RNA is designated SEQ ID:1783, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1783 is located at position

82741 relative to the genome of Rana tigrina ranavirus.

[25116] VGAM1797 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25117] An enzyme complex designated DICER COMPLEX, dices the VGAM1797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1797 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1797 RNA is designated SEQ ID:4508, and is provided hereinbelow with reference to the sequence listing part.

[25118] VGAM1797 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25119] VGAM1797 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1797 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25120] The complementary binding of VGAM1797 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1797 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25121] It is appreciated that VGAM1797 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1797 host target genes. The mRNA of each one of this plurality of VGAM1797 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1797 RNA, herein designated VGAM RNA, and which when bound by VGAM1797 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1797 host target proteins.

[25122] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1797 gene, herein designated VGAM GENE, on one or more VGAM1797 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25123] It is yet further appreciated that a function of VGAM1797 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1797 correlate with, and may be deduced from, the identity of the host target genes which VGAM1797 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25124] Nucleotide sequences of the VGAM1797 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1797 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1797 are further described hereinbelow with reference to Table 1.

[25125] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1797 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25126] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1798 (VGAM1798) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25127] VGAM1798 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1798 was detected is described hereinabove with reference to Figs. 2-8.

[25128] VGAM1798 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1798 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25129] VGAM1798 gene, herein designated VGAM GENE, encodes a VGAM1798 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1798 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1798 precursor RNA is designated SEQ ID:1784, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1784 is located at position 85493 relative to the genome of Rana tigrina ranavirus.

[25130] VGAM1798 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25131] An enzyme complex designated DICER COMPLEX, dices the VGAM1798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1798 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1798 RNA is designated SEQ ID:4509, and is provided hereinbelow with reference to the sequence

listing part.

[25132] VGAM1798 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25133] VGAM1798 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1798 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1798 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25134] The complementary binding of VGAM1798 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1798 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25135] It is appreciated that VGAM1798 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1798 host target genes. The mRNA of each one of this plurality of VGAM1798 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1798 RNA, herein designated VGAM RNA, and which when bound by VGAM1798 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1798 host target proteins.

[25136] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1798 gene, herein designated VGAM GENE, on one or more VGAM1798 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25137] It is yet further appreciated that a function of VGAM1798

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1798 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1798 correlate with, and may be deduced from, the identity of the host target genes which VGAM1798 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25138] Nucleotide sequences of the VGAM1798 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1798 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1798 are further described hereinbelow with reference to Table 1.

[25139] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1798 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25140] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1799 (VGAM1799) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25141] VGAM1799 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1799 was detected is described hereinabove with reference to Figs. 2-8.

[25142] VGAM1799 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1799 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25143] VGAM1799 gene, herein designated VGAM GENE, encodes a VGAM1799 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1799 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1799 precursor RNA is designated SEQ ID:1785, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1785 is located at position 30160 relative to the genome of Tupaia herpesvirus.

[25144] VGAM1799 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25145] An enzyme complex designated DICER COMPLEX, dices the VGAM1799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1799 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1799 RNA is designated SEQ ID:4510, and

is provided hereinbelow with reference to the sequence listing part.

[25146] VGAM1799 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25147] VGAM1799 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1799 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1799 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25148] The complementary binding of VGAM1799 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1799 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25149] It is appreciated that VGAM1799 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1799 host target genes. The mRNA of each one of this plurality of VGAM1799 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1799 RNA, herein designated VGAM RNA, and which when bound by VGAM1799 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1799 host target proteins.

[25150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1799 gene, herein designated VGAM GENE, on one or more VGAM1799 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25151] It is yet further appreciated that a function of VGAM1799 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1799 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1799 correlate with, and may be deduced from, the identity of the host target genes which VGAM1799 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25152] Nucleotide sequences of the VGAM1799 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1799 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1799 are further described hereinbelow with reference to Table 1.

[25153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1799 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25154] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1800 (VGAM1800) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25155] VGAM1800 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1800 was detected is described hereinabove with reference to Figs. 2-8.

[25156] VGAM1800 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1800 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25157] VGAM1800 gene, herein designated VGAM GENE, encodes a VGAM1800 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1800 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1800 precur-

sor RNA is designated SEQ ID:1786, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1786 is located at position 23754 relative to the genome of Tupaia herpesvirus.

[25158] VGAM1800 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25159] An enzyme complex designated DICER COMPLEX, dices the VGAM1800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1800 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM1800 RNA is designated SEQ ID:4511, and is provided hereinbelow with reference to the sequence listing part.

[25160] VGAM1800 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25161] VGAM1800 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1800 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25162] The complementary binding of VGAM1800 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1800 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25163] It is appreciated that VGAM1800 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1800 host target genes. The mRNA of

each one of this plurality of VGAM1800 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1800 RNA, herein designated VGAM RNA, and which when bound by VGAM1800 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1800 host target proteins.

[25164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1800 gene, herein designated VGAM GENE, on one or more VGAM1800 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[25165] It is yet further appreciated that a function of VGAM1800 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1800 correlate with, and may be deduced from, the identity of the host target genes which VGAM1800 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25166] Nucleotide sequences of the VGAM1800 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1800 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1800 are further described hereinbelow with reference to Table 1.

[25167] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1800 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[25168] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1801 (VGAM1801) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25169] VGAM1801 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1801 was detected is described hereinabove with reference to Figs. 2-8.

[25170] VGAM1801 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1801 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25171] VGAM1801 gene, herein designated VGAM GENE, encodes a VGAM1801 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1801 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1801 precursor RNA is designated SEQ ID:1787, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1787 is located at position 28609 relative to the genome of Tupaia herpesvirus.

[25172] VGAM1801 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25173] An enzyme complex designated DICER COMPLEX, dices the VGAM1801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1801 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1801 RNA is designated SEQ ID:4512, and is provided hereinbelow with reference to the sequence listing part.

[25174] VGAM1801 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25175] VGAM1801 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1801 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1801 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25176] The complementary binding of VGAM1801 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1801 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25177] It is appreciated that VGAM1801 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1801 host target genes. The mRNA of each one of this plurality of VGAM1801 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1801 RNA, herein designated VGAM RNA, and which when bound by VGAM1801 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1801 host target proteins.

[25178] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1801 gene, herein designated VGAM GENE, on one or more VGAM1801 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25179] It is yet further appreciated that a function of VGAM1801 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1801 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1801 correlate with, and may be deduced from, the identity of the host target genes which VGAM1801 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25180] Nucleotide sequences of the VGAM1801 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1801 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1801 are further described hereinbelow with reference to Table 1.

[25181] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1801 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25182] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1802 (VGAM1802) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25183] VGAM1802 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1802 was detected is described hereinabove with reference to Figs. 2-8.

[25184] VGAM1802 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1802 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25185] VGAM1802 gene, herein designated VGAM GENE, encodes a VGAM1802 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1802 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1802 precursor RNA is designated SEQ ID:1788, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1788 is located at position 27372 relative to the genome of Tupaia herpesvirus.

[25186] VGAM1802 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25187] An enzyme complex designated DICER COMPLEX, dices the VGAM1802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1802 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1802 RNA is designated SEQ ID:4513, and is provided hereinbelow with reference to the sequence listing part.

[25188] VGAM1802 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25189] VGAM1802 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1802 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1802 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25190] The complementary binding of VGAM1802 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1802 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25191] It is appreciated that VGAM1802 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1802 host target genes. The mRNA of each one of this plurality of VGAM1802 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1802 RNA, herein designated VGAM RNA, and which when bound by VGAM1802 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1802 host target proteins.

[25192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1802 gene, herein designated VGAM GENE, on one or more VGAM1802 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25193] It is yet further appreciated that a function of VGAM1802 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1802 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1802 correlate with, and may be deduced from, the identity of the host target genes which VGAM1802 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25194] Nucleotide sequences of the VGAM1802 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1802 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1802 are further described hereinbelow with reference to Table 1.

[25195] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1802 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25196] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1803 (VGAM1803) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25197] VGAM1803 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1803 was detected is described hereinabove with reference to Figs. 2-8.

[25198] VGAM1803 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1803 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25199] VGAM1803 gene, herein designated VGAM GENE, encodes a VGAM1803 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1803 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1803 precursor RNA is designated SEQ ID:1789, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1789 is located at position 29560 relative to the genome of Tupaia herpesvirus.

[25200] VGAM1803 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25201] An enzyme complex designated DICER COMPLEX, dices the VGAM1803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1803 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1803 RNA is designated SEQ ID:4514, and is provided hereinbelow with reference to the sequence listing part.

[25202] VGAM1803 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25203] VGAM1803 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1803 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1803 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25204] The complementary binding of VGAM1803 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1803 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25205] It is appreciated that VGAM1803 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1803 host target genes. The mRNA of each one of this plurality of VGAM1803 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1803 RNA, herein designated VGAM RNA, and which when bound by VGAM1803 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1803 host target proteins.

[25206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1803 gene, herein designated VGAM GENE, on one or more VGAM1803 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25207] It is yet further appreciated that a function of VGAM1803 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1803 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1803 correlate with, and may be deduced from, the identity of the host target genes which VGAM1803 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25208] Nucleotide sequences of the VGAM1803 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1803 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1803 are further described hereinbelow with reference to Table 1.

[25209] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1803 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25210] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1804 (VGAM1804) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25211] VGAM1804 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1804 was detected is described hereinabove with reference to Figs. 2-8.

[25212] VGAM1804 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1804 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25213] VGAM1804 gene, herein designated VGAM GENE, encodes a VGAM1804 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1804 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1804 precursor RNA is designated SEQ ID:1790, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1790 is located at position 30515 relative to the genome of Tupaia herpesvirus.

[25214] VGAM1804 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25215] An enzyme complex designated DICER COMPLEX, dices the VGAM1804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1804 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1804 RNA is designated SEQ ID:4515, and is provided hereinbelow with reference to the sequence listing part.

[25216] VGAM1804 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25217] VGAM1804 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1804 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1804 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25218] The complementary binding of VGAM1804 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1804 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[25219] It is appreciated that VGAM1804 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1804 host target genes. The mRNA of each one of this plurality of VGAM1804 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1804 RNA, herein designated VGAM RNA, and which when bound by VGAM1804 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1804 host target proteins.

[25220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1804 gene, herein designated VGAM GENE, on one or more VGAM1804 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25221] It is yet further appreciated that a function of VGAM1804 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1804 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1804 correlate with, and may be deduced from, the identity of the host target genes which VGAM1804 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25222] Nucleotide sequences of the VGAM1804 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1804 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1804 are further described hereinbelow with reference to Table 1.

[25223] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1804 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25224] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1805 (VGAM1805) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25225] VGAM1805 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1805 was detected is described hereinabove with reference to Figs. 2-8.

[25226] VGAM1805 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1805 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25227] VGAM1805 gene, herein designated VGAM GENE, encodes a VGAM1805 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1805 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1805 precursor RNA is designated SEQ ID:1791, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1791 is located at position 33339 relative to the genome of Tupaia herpesvirus.

[25228] VGAM1805 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25229] An enzyme complex designated DICER COMPLEX, dices the VGAM1805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1805 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1805 RNA is designated SEQ ID:4516, and is provided hereinbelow with reference to the sequence listing part.

[25230] VGAM1805 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25231] VGAM1805 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1805 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1805 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25232] The complementary binding of VGAM1805 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1805 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25233] It is appreciated that VGAM1805 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1805 host target genes. The mRNA of each one of this plurality of VGAM1805 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1805 RNA, herein designated VGAM RNA, and which when bound by VGAM1805 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1805 host target proteins.

[25234] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1805 gene, herein designated VGAM GENE, on one or more VGAM1805 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25235] It is yet further appreciated that a function of VGAM1805 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1805 correlate with, and may be deduced from, the identity of the host target genes which VGAM1805 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25236] Nucleotide sequences of the VGAM1805 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1805 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1805 are further described hereinbelow with reference to Table 1.

[25237] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1805 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25238] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1806 (VGAM1806) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25239] VGAM1806 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1806 was detected is described hereinabove with reference to Figs. 2-8.

[25240] VGAM1806 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1806 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25241] VGAM1806 gene, herein designated VGAM GENE, encodes

a VGAM1806 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1806 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1806 precursor RNA is designated SEQ ID:1792, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1792 is located at position 25245 relative to the genome of Tupaia herpesvirus.

[25242] VGAM1806 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25243] An enzyme complex designated DICER COMPLEX, dices the VGAM1806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1806 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1806 RNA is designated SEQ ID:4517, and is provided hereinbelow with reference to the sequence listing part.

[25244] VGAM1806 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25245] VGAM1806 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1806 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25246] The complementary binding of VGAM1806 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1806 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1806 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25247] It is appreciated that VGAM1806 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1806 host target genes. The mRNA of each one of this plurality of VGAM1806 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1806 RNA, herein designated VGAM RNA, and which when bound by VGAM1806 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1806 host target proteins.

[25248] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1806 gene, herein designated VGAM GENE, on one or more VGAM1806 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25249] It is yet further appreciated that a function of VGAM1806 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1806 correlate with, and may be deduced from, the identity of the host target genes which VGAM1806 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25250] Nucleotide sequences of the VGAM1806 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1806 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1806 are further

described hereinbelow with reference to Table 1.

[25251] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1806 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25252] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1807 (VGAM1807) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25253] VGAM1807 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1807 was detected is described hereinabove with reference to Figs. 2-8.

[25254] VGAM1807 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1807 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25255] VGAM1807 gene, herein designated VGAM GENE, encodes a VGAM1807 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1807 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1807 precursor RNA is designated SEQ ID:1793, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1793 is located at position 16749 relative to the genome of Rana tigrina ranavirus.

[25256] VGAM1807 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25257] An enzyme complex designated DICER COMPLEX, dices the VGAM1807 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1807 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1807 RNA is designated SEQ ID:4518, and is provided hereinbelow with reference to the sequence listing part.

[25258] VGAM1807 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25259] VGAM1807 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1807 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1807 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25260] The complementary binding of VGAM1807 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1807

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1807 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25261] It is appreciated that VGAM1807 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1807 host target genes. The mRNA of each one of this plurality of VGAM1807 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1807 RNA, herein designated VGAM RNA, and which when bound by VGAM1807 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1807 host target proteins.

[25262] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1807 gene, herein designated VGAM GENE, on one or more VGAM1807 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25263] It is yet further appreciated that a function of VGAM1807 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1807 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1807 correlate with, and may be deduced from, the identity of the host target genes which VGAM1807 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25264] Nucleotide sequences of the VGAM1807 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1807 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1807 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1807 are further described hereinbelow with reference to Table 1.

[25265] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1807 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25266] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1808 (VGAM1808) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25267] VGAM1808 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1808 was detected is described hereinabove with reference to Figs. 2-8.

[25268] VGAM1808 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1808 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[25269] VGAM1808 gene, herein designated VGAM GENE, encodes a VGAM1808 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1808 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1808 precursor RNA is designated SEQ ID:1794, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1794 is located at position 27725 relative to the genome of Rana tigrina ranavirus.

[25270] VGAM1808 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25271] An enzyme complex designated DICER COMPLEX, dices

the VGAM1808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1808 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1808 RNA is designated SEQ ID:4519, and is provided hereinbelow with reference to the sequence listing part.

[25272] VGAM1808 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25273] VGAM1808 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1808 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1808 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25274] The complementary binding of VGAM1808 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1808 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25275] It is appreciated that VGAM1808 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1808 host target genes. The mRNA of each one of this plurality of VGAM1808 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1808 RNA, herein designated VGAM RNA, and which when bound by VGAM1808 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1808 host target proteins.

[25276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1808 gene, herein designated VGAM GENE, on one or more VGAM1808 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25277] It is yet further appreciated that a function of VGAM1808 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1808 correlate with, and may be deduced from, the identity of the host target genes which VGAM1808 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25278] Nucleotide sequences of the VGAM1808 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1808 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1808 are further described hereinbelow with reference to Table 1.

[25279] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1808 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25280] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1809 (VGAM1809) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25281] VGAM1809 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1809 was detected is described hereinabove with reference to Figs. 2-8.

[25282] VGAM1809 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1809 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[25283] VGAM1809 gene, herein designated VGAM GENE, encodes a VGAM1809 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1809 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1809 precursor RNA is designated SEQ ID:1795, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1795 is located at position 28383 relative to the genome of Rana tigrina ranavirus.

[25284] VGAM1809 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25285] An enzyme complex designated DICER COMPLEX, dices the VGAM1809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1809 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1809 RNA is designated SEQ ID:4520, and is provided hereinbelow with reference to the sequence listing part.

[25286] VGAM1809 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25287] VGAM1809 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1809 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1809 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25288] The complementary binding of VGAM1809 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1809 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1809 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25289] It is appreciated that VGAM1809 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1809 host target genes. The mRNA of each one of this plurality of VGAM1809 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1809 RNA, herein designated VGAM RNA, and which when bound by VGAM1809 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1809 host target proteins.

[25290] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1809 gene, herein designated VGAM GENE, on one or more VGAM1809 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25291] It is yet further appreciated that a function of VGAM1809 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1809 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1809 correlate with, and may be deduced from, the identity of the host target genes which VGAM1809 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25292] Nucleotide sequences of the VGAM1809 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1809 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1809 are further described hereinbelow with reference to Table 1.

[25293] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1809 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25294] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1810 (VGAM1810) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25295] VGAM1810 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1810 was detected is described hereinabove with reference to Figs. 2-8.

[25296] VGAM1810 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1.

VGAM1810 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25297] VGAM1810 gene, herein designated VGAM GENE, encodes a VGAM1810 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1810 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1810 precursor RNA is designated SEQ ID:1796, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1796 is located at position 128214 relative to the genome of Equine herpesvirus 1.

[25298] VGAM1810 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[25299] An enzyme complex designated DICER COMPLEX, dices the VGAM1810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1810 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM1810 RNA is designated SEQ ID:4521, and is provided hereinbelow with reference to the sequence listing part.

[25300] VGAM1810 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25301] VGAM1810 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1810 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25302] The complementary binding of VGAM1810 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1810 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25303] It is appreciated that VGAM1810 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1810 host target genes. The mRNA of each one of this plurality of VGAM1810 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1810 RNA, herein designated VGAM RNA, and which when bound by VGAM1810 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1810 host target proteins.

[25304] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1810 gene, herein designated VGAM GENE, on one or more VGAM1810 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25305] It is yet further appreciated that a function of VGAM1810 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1810 correlate with, and may be deduced from, the identity of the host target genes which VGAM1810 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25306] Nucleotide sequences of the VGAM1810 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1810 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1810 are further described hereinbelow with reference to Table 1.

[25307] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1810 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25308] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1811 (VGAM1811) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25309] VGAM1811 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1811 was detected is described hereinabove with reference to Figs. 2-8.

[25310] VGAM1811 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine herpesvirus 1. VGAM1811 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25311] VGAM1811 gene, herein designated VGAM GENE, encodes a VGAM1811 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1811 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1811 precursor RNA is designated SEQ ID:1797, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1797 is located at position 132691 relative to the genome of Equine herpesvirus 1.

[25312] VGAM1811 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25313] An enzyme complex designated DICER COMPLEX, dices the VGAM1811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1811 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1811 RNA is designated SEQ ID:4522, and is provided hereinbelow with reference to the sequence listing part.

[25314] VGAM1811 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25315] VGAM1811 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1811 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25316] The complementary binding of VGAM1811 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1811 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25317] It is appreciated that VGAM1811 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1811 host target genes. The mRNA of each one of this plurality of VGAM1811 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1811 RNA, herein designated VGAM RNA, and which when bound by VGAM1811 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1811 host target proteins.

[25318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1811 gene, herein designated VGAM GENE, on one or more VGAM1811 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25319] It is yet further appreciated that a function of VGAM1811 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1811 correlate with, and may be deduced from, the identity of the host target genes which VGAM1811 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25320] Nucleotide sequences of the VGAM1811 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1811 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1811 are further described hereinbelow with reference to Table 1.

[25321] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1811 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25322] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1812 (VGAM1812) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25323] VGAM1812 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1812 was detected is described hereinabove with reference to Figs. 2-8.

[25324] VGAM1812 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1812 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25325] VGAM1812 gene, herein designated VGAM GENE, encodes a VGAM1812 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1812 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1812 precursor RNA is designated SEQ ID:1798, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1798 is located at position 129486 relative to the genome of Equine herpesvirus 1.

[25326] VGAM1812 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25327] An enzyme complex designated DICER COMPLEX, dices the VGAM1812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1812 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1812 RNA is designated SEQ ID:4523, and is provided hereinbelow with reference to the sequence listing part.

[25328] VGAM1812 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[25329] VGAM1812 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1812 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25330] The complementary binding of VGAM1812 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1812 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25331] It is appreciated that VGAM1812 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1812 host target genes. The mRNA of each one of this plurality of VGAM1812 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1812 RNA, herein designated VGAM RNA, and which when bound by VGAM1812 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1812 host target proteins.

[25332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1812 gene, herein designated VGAM GENE, on one

or more VGAM1812 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25333] It is yet further appreciated that a function of VGAM1812 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1812 correlate with, and may be deduced from, the identity of the host target genes which VGAM1812 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25334] Nucleotide sequences of the VGAM1812 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1812 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1812 are further described hereinbelow with reference to Table 1.

[25335] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1812 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25336] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1813 (VGAM1813) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25337] VGAM1813 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1813 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[25338] VGAM1813 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1813 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25339] VGAM1813 gene, herein designated VGAM GENE, encodes a VGAM1813 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1813 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1813 precursor RNA is designated SEQ ID:1799, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1799 is located at position 137114 relative to the genome of Equine herpesvirus 1.

[25340] VGAM1813 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25341] An enzyme complex designated DICER COMPLEX, dices the VGAM1813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1813 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1813 RNA is designated SEQ ID:4524, and is provided hereinbelow with reference to the sequence listing part.

[25342] VGAM1813 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25343] VGAM1813 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1813 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1813 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[25344] The complementary binding of VGAM1813 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1813 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25345] It is appreciated that VGAM1813 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1813 host target genes. The mRNA of each one of this plurality of VGAM1813 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1813 RNA, herein designated VGAM RNA, and which when bound by VGAM1813 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1813 host target proteins.

[25346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1813 gene, herein designated VGAM GENE, on one or more VGAM1813 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25347] It is yet further appreciated that a function of VGAM1813 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1813 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1813 correlate with, and may be deduced from, the identity of the host target genes which VGAM1813 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[25348] Nucleotide sequences of the VGAM1813 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1813 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1813 are further described hereinbelow with reference to Table 1.

[25349] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1813 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25350] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1814 (VGAM1814) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25351] VGAM1814 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1814 was detected is described hereinabove with reference to Figs. 2-8.

[25352] VGAM1814 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1814 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25353] VGAM1814 gene, herein designated VGAM GENE, encodes a VGAM1814 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1814 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1814 precursor RNA is designated SEQ ID:1800, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1800 is located at position 127841 relative to the genome of Equine herpesvirus 1.

[25354] VGAM1814 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25355] An enzyme complex designated DICER COMPLEX, dices the VGAM1814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1814 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1814 RNA is designated SEQ ID:4525, and is provided hereinbelow with reference to the sequence listing part.

[25356] VGAM1814 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25357] VGAM1814 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1814 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1814 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25358] The complementary binding of VGAM1814 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1814 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25359] It is appreciated that VGAM1814 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1814 host target genes. The mRNA of each one of this plurality of VGAM1814 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1814 RNA, herein designated VGAM RNA, and which when bound by VGAM1814 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1814 host target proteins.

[25360] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1814 gene, herein designated VGAM GENE, on one or more VGAM1814 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25361] It is yet further appreciated that a function of VGAM1814 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1814 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1814 correlate with, and may be deduced from, the identity of the host target genes which VGAM1814 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[25362] Nucleotide sequences of the VGAM1814 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1814 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1814 are further described hereinbelow with reference to Table 1.

[25363] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1814 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25364]

[25365] Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1815 (VGAM1815) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25366] VGAM1815 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1815 was detected is described hereinabove with reference to Figs. 2-8.

[25367] VGAM1815 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1815 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25368] VGAM1815 gene, herein designated VGAM GENE, encodes a VGAM1815 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1815 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1815 precursor RNA is designated SEQ ID:1801, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1801 is located at position 130995 relative to the genome of Equine herpesvirus 1.

[25369] VGAM1815 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25370] An enzyme complex designated DICER COMPLEX, dices the VGAM1815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1815 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1815 RNA is designated SEQ ID:4526, and is provided hereinbelow with reference to the sequence listing part.

[25371] VGAM1815 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25372] VGAM1815 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1815 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1815 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25373] The complementary binding of VGAM1815 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1815 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25374] It is appreciated that VGAM1815 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1815 host target genes. The mRNA of each one of this plurality of VGAM1815 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1815 RNA, herein designated VGAM RNA, and which when bound by VGAM1815 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1815 host target proteins.

[25375] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1815 gene, herein designated VGAM GENE, on one or more VGAM1815 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25376] It is yet further appreciated that a function of VGAM1815 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1815 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1815 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1815 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25377] Nucleotide sequences of the VGAM1815 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1815 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1815 are further described hereinbelow with reference to Table 1.

[25378] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1815 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25379] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1816 (VGAM1816) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25380] VGAM1816 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1816 was detected is described hereinabove with reference to Figs. 2-8.

[25381] VGAM1816 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1816 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25382] VGAM1816 gene, herein designated VGAM GENE, encodes a VGAM1816 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1816 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1816 precursor RNA is designated SEQ ID:1802, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1802 is located at position 41903 relative to the genome of Camelpox virus.

[25383] VGAM1816 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1816 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25384] An enzyme complex designated DICER COMPLEX, dices the VGAM1816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1816 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1816 RNA is designated SEQ ID:4527, and is provided hereinbelow with reference to the sequence listing part.

[25385] VGAM1816 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1816 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25386] VGAM1816 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1816 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25387] The complementary binding of VGAM1816 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1816 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25388] It is appreciated that VGAM1816 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1816 host target genes. The mRNA of each one of this plurality of VGAM1816 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1816 RNA, herein designated VGAM RNA, and which when bound by VGAM1816 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1816 host target proteins.

[25389] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1816 gene, herein designated VGAM GENE, on one or more VGAM1816 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25390] It is yet further appreciated that a function of VGAM1816 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1816 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1816 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25391] Nucleotide sequences of the VGAM1816 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1816 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1816 are further described hereinbelow with reference to Table 1.

[25392] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1816 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25393] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1817 (VGAM1817) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[25394] VGAM1817 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1817 was detected is described hereinabove with reference to Figs. 2-8.

[25395] VGAM1817 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1817 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25396] VGAM1817 gene, herein designated VGAM GENE, encodes a VGAM1817 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1817 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1817 precursor RNA is designated SEQ ID:1803, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1803 is located at position 27215 relative to the genome of Variola virus.

[25397] VGAM1817 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1817 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25398] An enzyme complex designated DICER COMPLEX, dices the VGAM1817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1817 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1817 RNA is designated SEQ ID:4528, and is provided hereinbelow with reference to the sequence listing part.

[25399] VGAM1817 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1817 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25400] VGAM1817 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1817 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1817 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25401] The complementary binding of VGAM1817 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1817 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25402] It is appreciated that VGAM1817 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1817 host target genes. The mRNA of each one of this plurality of VGAM1817 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1817 RNA, herein designated VGAM RNA, and which when bound by VGAM1817 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1817 host target proteins.

[25403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1817 gene, herein designated VGAM GENE, on one or more VGAM1817 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25404] It is yet further appreciated that a function of VGAM1817 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1817 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1817 correlate

with, and may be deduced from, the identity of the host target genes which VGAM1817 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25405] Nucleotide sequences of the VGAM1817 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1817 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1817 are further described hereinbelow with reference to Table 1.

[25406] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1817 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25407] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1818 (VGAM1818) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[25408] VGAM1818 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1818 was detected is described hereinabove with reference to Figs. 2-8.

[25409] VGAM1818 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1818 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25410] VGAM1818 gene, herein designated VGAM GENE, encodes a VGAM1818 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1818 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1818 precursor RNA is designated SEQ ID:1804, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1804 is located at position 28707 relative to the genome of Variola virus.

[25411] VGAM1818 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1818 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25412] An enzyme complex designated DICER COMPLEX, dices the VGAM1818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1818 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1818 RNA is designated SEQ ID:4529, and is provided hereinbelow with reference to the sequence listing part.

[25413] VGAM1818 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1818 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25414] VGAM1818 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1818 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1818 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25415] The complementary binding of VGAM1818 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1818 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25416] It is appreciated that VGAM1818 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1818 host target genes. The mRNA of each one of this plurality of VGAM1818 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1818 RNA, herein designated VGAM RNA, and which when bound by VGAM1818 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1818 host target proteins.

[25417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1818 gene, herein designated VGAM GENE, on one or more VGAM1818 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25418] It is yet further appreciated that a function of VGAM1818 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1818 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1818 correlate

with, and may be deduced from, the identity of the host target genes which VGAM1818 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25419] Nucleotide sequences of the VGAM1818 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1818 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1818 are further described hereinbelow with reference to Table 1.

[25420] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1818 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25421] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1819 (VGAM1819) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[25422] VGAM1819 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1819 was detected is described hereinabove with reference to Figs. 2-8.

[25423] VGAM1819 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus. VGAM1819 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25424] VGAM1819 gene, herein designated VGAM GENE, encodes a VGAM1819 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1819 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1819 precursor RNA is designated SEQ ID:1805, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1805 is located at position 7183 relative to the genome of Cryphonectria hypovirus.

[25425] VGAM1819 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1819 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25426] An enzyme complex designated DICER COMPLEX, dices the VGAM1819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1819 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1819 RNA is designated SEQ ID:4530, and is provided hereinbelow with reference to the sequence listing part.

[25427] VGAM1819 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1819 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1819 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25428] VGAM1819 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1819 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1819 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1819 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1819 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25429] The complementary binding of VGAM1819 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1819 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1819 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1819 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25430] It is appreciated that VGAM1819 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1819 host target genes. The mRNA of each one of this plurality of VGAM1819 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1819 RNA, herein designated VGAM RNA, and which when bound by VGAM1819 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1819 host target proteins.

[25431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1819 gene, herein designated VGAM GENE, on one or more VGAM1819 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25432] It is yet further appreciated that a function of VGAM1819 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1819 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus.

Specific functions, and accordingly utilities, of VGAM1819 correlate with, and may be deduced from, the identity of the host target genes which VGAM1819 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25433] Nucleotide sequences of the VGAM1819 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1819 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1819 are further described hereinbelow with reference to Table 1.

[25434] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1819 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25435] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1820 (VGAM1820) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[25436] VGAM1820 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1820 was detected is described hereinabove with reference to Figs. 2-8.

[25437] VGAM1820 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus. VGAM1820 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25438] VGAM1820 gene, herein designated VGAM GENE, encodes a VGAM1820 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1820 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1820 precursor RNA is designated SEQ ID:1806, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1806 is located at position 7825 relative to the genome of Cryphonectria hypovirus.

[25439] VGAM1820 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25440] An enzyme complex designated DICER COMPLEX, dices the VGAM1820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1820 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1820 RNA is designated SEQ ID:4531, and is provided hereinbelow with reference to the sequence listing part.

[25441] VGAM1820 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25442] VGAM1820 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1820 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1820 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25443] The complementary binding of VGAM1820 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1820 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25444] It is appreciated that VGAM1820 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1820 host target genes. The mRNA of each one of this plurality of VGAM1820 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1820 RNA, herein designated VGAM RNA, and which when bound by VGAM1820 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1820 host target proteins.

[25445] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1820 gene, herein designated VGAM GENE, on one or more VGAM1820 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25446] It is yet further appreciated that a function of VGAM1820 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1820 include diagnosis, prevention and

treatment of viral infection by Cryphonectria hypovirus. Specific functions, and accordingly utilities, of VGAM1820 correlate with, and may be deduced from, the identity of the host target genes which VGAM1820 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25447] Nucleotide sequences of the VGAM1820 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1820 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1820 are further described hereinbelow with reference to Table 1.

[25448] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1820 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25449] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1821 (VGAM1821) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25450] VGAM1821 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1821 was detected is described hereinabove with reference to Figs. 2-8.

[25451] VGAM1821 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1821 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25452] VGAM1821 gene, herein designated VGAM GENE, encodes a VGAM1821 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1821 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1821 precursor RNA is designated SEQ ID:1807, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1807 is located at position 28943 relative to the genome of Variola virus.

[25453] VGAM1821 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25454] An enzyme complex designated DICER COMPLEX, dices the VGAM1821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1821 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1821 RNA is designated SEQ ID:4532, and is provided hereinbelow with reference to the sequence listing part.

[25455] VGAM1821 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1821 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1821 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25456] VGAM1821 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1821 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1821 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1821 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1821 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25457] The complementary binding of VGAM1821 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1821 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1821 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1821 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25458] It is appreciated that VGAM1821 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1821 host target genes. The mRNA of each one of this plurality of VGAM1821 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1821 RNA, herein designated VGAM RNA, and which when bound by VGAM1821 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1821 host target proteins.

[25459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1821 gene, herein designated VGAM GENE, on one or more VGAM1821 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25460] It is yet further appreciated that a function of VGAM1821 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1821 include diagnosis, prevention and

treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1821 correlate with, and may be deduced from, the identity of the host target genes which VGAM1821 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25461] Nucleotide sequences of the VGAM1821 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1821 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1821 are further described hereinbelow with reference to Table 1.

[25462] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1821 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25463] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1822 (VGAM1822) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25464] VGAM1822 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1822 was detected is described hereinabove with reference to Figs. 2-8.

[25465] VGAM1822 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus. VGAM1822 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25466] VGAM1822 gene, herein designated VGAM GENE, encodes a VGAM1822 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1822 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1822 precursor RNA is designated SEQ ID:1808, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1808 is located at position 9148 relative to the genome of Cryphonectria hypovirus.

[25467] VGAM1822 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25468] An enzyme complex designated DICER COMPLEX, dices the VGAM1822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1822 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1822 RNA is designated SEQ ID:4533, and is provided hereinbelow with reference to the sequence listing part.

[25469] VGAM1822 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25470] VGAM1822 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1822 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1822 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25471] The complementary binding of VGAM1822 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1822 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25472] It is appreciated that VGAM1822 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1822 host target genes. The mRNA of each one of this plurality of VGAM1822 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1822 RNA, herein designated VGAM

RNA, and which when bound by VGAM1822 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1822 host target proteins.

[25473] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1822 gene, herein designated VGAM GENE, on one or more VGAM1822 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25474] It is yet further appreciated that a function of VGAM1822 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1822 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus. Specific functions, and accordingly utilities, of VGAM1822 correlate with, and may be deduced from, the identity of the host target genes which VGAM1822 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25475] Nucleotide sequences of the VGAM1822 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1822 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1822 are further described hereinbelow with reference to Table 1.

[25476] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1822 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25477] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1823 (VGAM1823) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25478] VGAM1823 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1823 was detected is described hereinabove with reference to Figs. 2-8.

[25479] VGAM1823 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus. VGAM1823 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25480] VGAM1823 gene, herein designated VGAM GENE, encodes a VGAM1823 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1823 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1823 precursor RNA is designated SEQ ID:1809, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1809 is located at position 3317

relative to the genome of Cryphonectria hypovirus.

[25481] VGAM1823 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25482] An enzyme complex designated DICER COMPLEX, dices the VGAM1823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1823 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1823 RNA is designated SEQ ID:4534, and is provided hereinbelow with reference to the sequence listing part.

[25483] VGAM1823 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25484] VGAM1823 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1823 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1823 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25485] The complementary binding of VGAM1823 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1823 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25486] It is appreciated that VGAM1823 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1823 host target genes. The mRNA of each one of this plurality of VGAM1823 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1823 RNA, herein designated VGAM RNA, and which when bound by VGAM1823 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1823 host target proteins.

[25487] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1823 gene, herein designated VGAM GENE, on one or more VGAM1823 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25488] It is yet further appreciated that a function of VGAM1823 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1823 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus. Specific functions, and accordingly utilities, of VGAM1823 correlate with, and may be deduced from, the identity of the host target genes which VGAM1823 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25489] Nucleotide sequences of the VGAM1823 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1823 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1823 are further described hereinbelow with reference to Table 1.

[25490] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1823 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25491] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1824 (VGAM1824) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25492] VGAM1824 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1824 was detected is described hereinabove with reference to Figs. 2-8.

[25493] VGAM1824 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus. VGAM1824 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25494] VGAM1824 gene, herein designated VGAM GENE, encodes a VGAM1824 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1824 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1824 precursor RNA is designated SEQ ID:1810, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1810 is located at position 3901 relative to the genome of Cryphonectria hypovirus.

[25495] VGAM1824 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25496] An enzyme complex designated DICER COMPLEX, dices the VGAM1824 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1824 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1824 RNA is designated SEQ ID:4535, and is provided hereinbelow with reference to the sequence listing part.

[25497] VGAM1824 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1824 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1824 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25498] VGAM1824 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1824 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1824 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1824 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1824 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25499] The complementary binding of VGAM1824 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1824 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1824

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1824 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25500] It is appreciated that VGAM1824 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1824 host target genes. The mRNA of each one of this plurality of VGAM1824 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1824 RNA, herein designated VGAM RNA, and which when bound by VGAM1824 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1824 host target proteins.

[25501] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1824 gene, herein designated VGAM GENE, on one or more VGAM1824 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25502] It is yet further appreciated that a function of VGAM1824 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1824 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus. Specific functions, and accordingly utilities, of VGAM1824 correlate with, and may be deduced from, the identity of the host target genes which VGAM1824 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25503] Nucleotide sequences of the VGAM1824 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1824 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1824 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1824 are further described hereinbelow with reference to Table 1.

[25504] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1824 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25505] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1825 (VGAM1825) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25506] VGAM1825 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1825 was detected is described hereinabove with reference to Figs. 2-8.

[25507] VGAM1825 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.
VGAM1825 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[25508] VGAM1825 gene, herein designated VGAM GENE, encodes a VGAM1825 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1825 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1825 precursor RNA is designated SEQ ID:1811, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1811 is located at position 34526 relative to the genome of Vaccinia virus.

[25509] VGAM1825 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25510] An enzyme complex designated DICER COMPLEX, dices

the VGAM1825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1825 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1825 RNA is designated SEQ ID:4536, and is provided hereinbelow with reference to the sequence listing part.

[25511] VGAM1825 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25512] VGAM1825 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1825 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1825 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1825 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25513] The complementary binding of VGAM1825 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1825 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25514] It is appreciated that VGAM1825 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1825 host target genes. The mRNA of each one of this plurality of VGAM1825 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1825 RNA, herein designated VGAM RNA, and which when bound by VGAM1825 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1825 host target proteins.

[25515] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1825 gene, herein designated VGAM GENE, on one or more VGAM1825 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25516] It is yet further appreciated that a function of VGAM1825 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1825 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM1825 correlate with, and may be deduced from, the identity of the host target genes which VGAM1825 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25517] Nucleotide sequences of the VGAM1825 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1825 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1825 are further described hereinbelow with reference to Table 1.

[25518] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1825 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25519] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1826 (VGAM1826) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25520] VGAM1826 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1826 was detected is described hereinabove with reference to Figs. 2-8.

[25521] VGAM1826 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1826 host target gene, herein designated VGAM HOST TARGET

GENE, is a human gene contained in the human genome.

[25522] VGAM1826 gene, herein designated VGAM GENE, encodes a VGAM1826 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1826 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1826 precursor RNA is designated SEQ ID:1812, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1812 is located at position 29285 relative to the genome of Variola virus.

[25523] VGAM1826 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25524] An enzyme complex designated DICER COMPLEX, dices

the VGAM1826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1826 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1826 RNA is designated SEQ ID:4537, and is provided hereinbelow with reference to the sequence listing part.

[25525] VGAM1826 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25526] VGAM1826 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1826 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1826 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25527] The complementary binding of VGAM1826 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1826 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25528] It is appreciated that VGAM1826 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1826 host target genes. The mRNA of each one of this plurality of VGAM1826 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1826 RNA, herein designated VGAM RNA, and which when bound by VGAM1826 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1826 host target proteins.

[25529] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1826 gene, herein designated VGAM GENE, on one or more VGAM1826 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25530] It is yet further appreciated that a function of VGAM1826 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1826 correlate with, and may be deduced from, the identity of the host target genes which VGAM1826 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25531] Nucleotide sequences of the VGAM1826 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1826 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1826 are further described hereinbelow with reference to Table 1.

[25532] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1826 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25533] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1827 (VGAM1827) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25534] VGAM1827 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1827 was detected is described hereinabove with reference to Figs. 2-8.

[25535] VGAM1827 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM1827 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[25536] VGAM1827 gene, herein designated VGAM GENE, encodes a VGAM1827 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1827 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1827 precursor RNA is designated SEQ ID:1813, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1813 is located at position 144104 relative to the genome of Rabbit fibroma virus.

[25537] VGAM1827 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25538] An enzyme complex designated DICER COMPLEX, dices the VGAM1827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1827 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1827 RNA is designated SEQ ID:4538, and is provided hereinbelow with reference to the sequence listing part.

[25539] VGAM1827 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25540] VGAM1827 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1827 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1827 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25541] The complementary binding of VGAM1827 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1827 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1827 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25542] It is appreciated that VGAM1827 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1827 host target genes. The mRNA of each one of this plurality of VGAM1827 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1827 RNA, herein designated VGAM RNA, and which when bound by VGAM1827 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1827 host target proteins.

[25543] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1827 gene, herein designated VGAM GENE, on one or more VGAM1827 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25544] It is yet further appreciated that a function of VGAM1827 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1827 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM1827 correlate with, and may be deduced from, the identity of the host target genes which VGAM1827 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25545] Nucleotide sequences of the VGAM1827 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1827 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1827 are further described hereinbelow with reference to Table 1.

[25546] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1827 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25547] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1828 (VGAM1828) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25548] VGAM1828 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1828 was detected is described hereinabove with reference to Figs. 2-8.

[25549] VGAM1828 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus.

VGAM1828 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25550] VGAM1828 gene, herein designated VGAM GENE, encodes a VGAM1828 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1828 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1828 precursor RNA is designated SEQ ID:1814, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1814 is located at position 140535 relative to the genome of Rabbit fibroma virus.

[25551] VGAM1828 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[25552] An enzyme complex designated DICER COMPLEX, dices the VGAM1828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1828 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1828 RNA is designated SEQ ID:4539, and is provided hereinbelow with reference to the sequence listing part.

[25553] VGAM1828 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25554] VGAM1828 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1828 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1828 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25555] The complementary binding of VGAM1828 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1828 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25556] It is appreciated that VGAM1828 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1828 host target genes. The mRNA of each one of this plurality of VGAM1828 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1828 RNA, herein designated VGAM RNA, and which when bound by VGAM1828 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1828 host target proteins.

[25557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1828 gene, herein designated VGAM GENE, on one or more VGAM1828 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25558] It is yet further appreciated that a function of VGAM1828 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1828 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM1828 correlate with, and may be deduced from, the identity of the host target genes which VGAM1828 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25559] Nucleotide sequences of the VGAM1828 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1828 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1828 are further described hereinbelow with reference to Table 1.

[25560] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1828 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25561] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1829 (VGAM1829) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25562] VGAM1829 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1829 was detected is described hereinabove with reference to Figs. 2-8.

[25563] VGAM1829 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Rabbit fibroma virus. VGAM1829 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25564] VGAM1829 gene, herein designated VGAM GENE, encodes a VGAM1829 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1829 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1829 precursor RNA is designated SEQ ID:1815, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1815 is located at position 140030 relative to the genome of Rabbit fibroma virus.

[25565] VGAM1829 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25566] An enzyme complex designated DICER COMPLEX, dices the VGAM1829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1829 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1829 RNA is designated SEQ ID:4540, and is provided hereinbelow with reference to the sequence listing part.

[25567] VGAM1829 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25568] VGAM1829 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1829 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1829 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25569] The complementary binding of VGAM1829 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1829 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25570] It is appreciated that VGAM1829 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1829 host target genes. The mRNA of each one of this plurality of VGAM1829 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1829 RNA, herein designated VGAM RNA, and which when bound by VGAM1829 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1829 host target proteins.

[25571] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1829 gene, herein designated VGAM GENE, on one or more VGAM1829 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25572] It is yet further appreciated that a function of VGAM1829 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1829 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM1829 correlate with, and may be deduced from, the identity of the host target genes which VGAM1829 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25573] Nucleotide sequences of the VGAM1829 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1829 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1829 are further described hereinbelow with reference to Table 1.

[25574] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1829 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25575] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1830 (VGAM1830) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25576] VGAM1830 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1830 was detected is described hereinabove with reference to Figs. 2-8.

[25577] VGAM1830 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1830 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25578] VGAM1830 gene, herein designated VGAM GENE, encodes a VGAM1830 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1830 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1830 precursor RNA is designated SEQ ID:1816, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1816 is located at position 40729 relative to the genome of Camelpox virus.

[25579] VGAM1830 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25580] An enzyme complex designated DICER COMPLEX, dices the VGAM1830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1830 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1830 RNA is designated SEQ ID:4541, and is provided hereinbelow with reference to the sequence listing part.

[25581] VGAM1830 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[25582] VGAM1830 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1830 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1830 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25583] The complementary binding of VGAM1830 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1830 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25584] It is appreciated that VGAM1830 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1830 host target genes. The mRNA of each one of this plurality of VGAM1830 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1830 RNA, herein designated VGAM RNA, and which when bound by VGAM1830 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1830 host target proteins.

[25585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1830 gene, herein designated VGAM GENE, on one

or more VGAM1830 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25586] It is yet further appreciated that a function of VGAM1830 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1830 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1830 correlate with, and may be deduced from, the identity of the host target genes which VGAM1830 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25587] Nucleotide sequences of the VGAM1830 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1830 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1830 are further described hereinbelow with reference to Table 1.

[25588] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1830 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25589] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1831 (VGAM1831) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25590] VGAM1831 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1831 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[25591] VGAM1831 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1831 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25592] VGAM1831 gene, herein designated VGAM GENE, encodes a VGAM1831 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1831 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1831 precursor RNA is designated SEQ ID:1817, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1817 is located at position 40965 relative to the genome of Camelpox virus.

[25593] VGAM1831 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25594] An enzyme complex designated DICER COMPLEX, dices the VGAM1831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1831 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1831 RNA is designated SEQ ID:4542, and is provided hereinbelow with reference to the sequence listing part.

[25595] VGAM1831 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25596] VGAM1831 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1831 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1831 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[25597] The complementary binding of VGAM1831 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1831 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25598] It is appreciated that VGAM1831 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1831 host target genes. The mRNA of each one of this plurality of VGAM1831 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1831 RNA, herein designated VGAM RNA, and which when bound by VGAM1831 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1831 host target proteins.

[25599] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1831 gene, herein designated VGAM GENE, on one or more VGAM1831 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25600] It is yet further appreciated that a function of VGAM1831 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1831 correlate with, and may be deduced from, the identity of the host target genes which VGAM1831 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[25601] Nucleotide sequences of the VGAM1831 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1831 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1831 are further described hereinbelow with reference to Table 1.

[25602] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1831 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25603] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1832 (VGAM1832) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25604] VGAM1832 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1832 was detected is described hereinabove with reference to Figs. 2-8.

[25605] VGAM1832 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1832 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25606] VGAM1832 gene, herein designated VGAM GENE, encodes a VGAM1832 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1832 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1832 precursor RNA is designated SEQ ID:1818, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1818 is located at position 38937 relative to the genome of Camelpox virus.

[25607] VGAM1832 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25608] An enzyme complex designated DICER COMPLEX, dices the VGAM1832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1832 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1832 RNA is designated SEQ ID:4543, and is provided hereinbelow with reference to the sequence listing part.

[25609] VGAM1832 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25610] VGAM1832 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1832 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1832 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25611] The complementary binding of VGAM1832 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1832 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25612] It is appreciated that VGAM1832 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1832 host target genes. The mRNA of each one of this plurality of VGAM1832 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1832 RNA, herein designated VGAM RNA, and which when bound by VGAM1832 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1832 host target proteins.

[25613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1832 gene, herein designated VGAM GENE, on one or more VGAM1832 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25614] It is yet further appreciated that a function of VGAM1832 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1832 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1832 correlate with, and may be deduced from, the identity of the host target genes which VGAM1832 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[25615] Nucleotide sequences of the VGAM1832 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1832 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1832 are further described hereinbelow with reference to Table 1.

[25616] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1832 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25617] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1833 (VGAM1833) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25618] VGAM1833 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1833 was detected is described hereinabove with reference to Figs. 2-8.

[25619] VGAM1833 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1833 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25620] VGAM1833 gene, herein designated VGAM GENE, encodes a VGAM1833 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1833 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1833 precursor RNA is designated SEQ ID:1819, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1819 is located at position 38839 relative to the genome of Camelpox virus.

[25621] VGAM1833 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25622] An enzyme complex designated DICER COMPLEX, dices the VGAM1833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1833 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1833 RNA is designated SEQ ID:4544, and is provided hereinbelow with reference to the sequence listing part.

[25623] VGAM1833 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25624] VGAM1833 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1833 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25625] The complementary binding of VGAM1833 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1833 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25626] It is appreciated that VGAM1833 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1833 host target genes. The mRNA of each one of this plurality of VGAM1833 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1833 RNA, herein designated VGAM RNA, and which when bound by VGAM1833 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1833 host target proteins.

[25627] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1833 gene, herein designated VGAM GENE, on one or more VGAM1833 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25628] It is yet further appreciated that a function of VGAM1833 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1833 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1833 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25629] Nucleotide sequences of the VGAM1833 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1833 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1833 are further described hereinbelow with reference to Table 1.

[25630] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1833 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25631] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1834 (VGAM1834) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25632] VGAM1834 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1834 was detected is described hereinabove with reference to Figs. 2-8.

[25633] VGAM1834 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1834 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25634] VGAM1834 gene, herein designated VGAM GENE, encodes a VGAM1834 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1834 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1834 precursor RNA is designated SEQ ID:1820, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1820 is located at position 36702 relative to the genome of Camelpox virus.

[25635] VGAM1834 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1834 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25636] An enzyme complex designated DICER COMPLEX, dices the VGAM1834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1834 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1834 RNA is designated SEQ ID:4545, and is provided hereinbelow with reference to the sequence listing part.

[25637] VGAM1834 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1834 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25638] VGAM1834 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1834 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25639] The complementary binding of VGAM1834 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1834 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25640] It is appreciated that VGAM1834 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1834 host target genes. The mRNA of each one of this plurality of VGAM1834 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1834 RNA, herein designated VGAM RNA, and which when bound by VGAM1834 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1834 host target proteins.

[25641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1834 gene, herein designated VGAM GENE, on one or more VGAM1834 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25642] It is yet further appreciated that a function of VGAM1834 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1834 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1834 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25643] Nucleotide sequences of the VGAM1834 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1834 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1834 are further described hereinbelow with reference to Table 1.

[25644] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1834 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25645] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1835 (VGAM1835) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[25646] VGAM1835 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1835 was detected is described hereinabove with reference to Figs. 2-8.

[25647] VGAM1835 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1835 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25648] VGAM1835 gene, herein designated VGAM GENE, encodes a VGAM1835 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1835 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1835 precursor RNA is designated SEQ ID:1821, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1821 is located at position 136546 relative to the genome of Fowlpox virus.

[25649] VGAM1835 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1835 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25650] An enzyme complex designated DICER COMPLEX, dices the VGAM1835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1835 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1835 RNA is designated SEQ ID:4546, and is provided hereinbelow with reference to the sequence listing part.

[25651] VGAM1835 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1835 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1835 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25652] VGAM1835 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1835 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1835 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1835 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1835 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25653] The complementary binding of VGAM1835 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1835 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1835 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1835 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25654] It is appreciated that VGAM1835 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1835 host target genes. The mRNA of each one of this plurality of VGAM1835 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1835 RNA, herein designated VGAM RNA, and which when bound by VGAM1835 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1835 host target proteins.

[25655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1835 gene, herein designated VGAM GENE, on one or more VGAM1835 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25656] It is yet further appreciated that a function of VGAM1835 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1835 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific

functions, and accordingly utilities, of VGAM1835 correlate with, and may be deduced from, the identity of the host target genes which VGAM1835 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25657] Nucleotide sequences of the VGAM1835 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1835 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1835 are further described hereinbelow with reference to Table 1.

[25658] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1835 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25659] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1836 (VGAM1836) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[25660] VGAM1836 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1836 was detected is described hereinabove with reference to Figs. 2-8.

[25661] VGAM1836 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1836 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25662] VGAM1836 gene, herein designated VGAM GENE, encodes a VGAM1836 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1836 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1836 precursor RNA is designated SEQ ID:1822, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1822 is located at position 140071 relative to the genome of Fowlpox virus.

[25663] VGAM1836 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25664] An enzyme complex designated DICER COMPLEX, dices the VGAM1836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1836 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1836 RNA is designated SEQ ID:4547, and is provided hereinbelow with reference to the sequence listing part.

[25665] VGAM1836 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1836 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1836 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25666] VGAM1836 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1836 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1836 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1836 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1836 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25667] The complementary binding of VGAM1836 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1836 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1836 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1836 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25668] It is appreciated that VGAM1836 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1836 host target genes. The mRNA of each one of this plurality of VGAM1836 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1836 RNA, herein designated VGAM RNA, and which when bound by VGAM1836 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1836 host target proteins.

[25669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1836 gene, herein designated VGAM GENE, on one or more VGAM1836 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25670] It is yet further appreciated that a function of VGAM1836 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1836 include diagnosis, prevention and

treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1836 correlate with, and may be deduced from, the identity of the host target genes which VGAM1836 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25671] Nucleotide sequences of the VGAM1836 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1836 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1836 are further described hereinbelow with reference to Table 1.

[25672] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1836 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25673] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1837 (VGAM1837) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25674] VGAM1837 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1837 was detected is described hereinabove with reference to Figs. 2-8.

[25675] VGAM1837 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1837 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25676] VGAM1837 gene, herein designated VGAM GENE, encodes a VGAM1837 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1837 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1837 precursor RNA is designated SEQ ID:1823, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1823 is located at position 133890 relative to the genome of Fowlpox virus.

[25677] VGAM1837 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25678] An enzyme complex designated DICER COMPLEX, dices the VGAM1837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1837 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1837 RNA is designated SEQ ID:4548, and is provided hereinbelow with reference to the sequence listing part.

[25679] VGAM1837 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25680] VGAM1837 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1837 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1837 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25681] The complementary binding of VGAM1837 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1837 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25682] It is appreciated that VGAM1837 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1837 host target genes. The mRNA of each one of this plurality of VGAM1837 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1837 RNA, herein designated VGAM

RNA, and which when bound by VGAM1837 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1837 host target proteins.

[25683] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1837 gene, herein designated VGAM GENE, on one or more VGAM1837 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25684] It is yet further appreciated that a function of VGAM1837 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1837 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1837 correlate with, and may be deduced from, the identity of the host target genes which VGAM1837 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25685] Nucleotide sequences of the VGAM1837 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1837 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1837 are further described hereinbelow with reference to Table 1.

[25686] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1837 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25687] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1838 (VGAM1838) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25688] VGAM1838 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1838 was detected is described hereinabove with reference to Figs. 2-8.

[25689] VGAM1838 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1838 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25690] VGAM1838 gene, herein designated VGAM GENE, encodes a VGAM1838 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1838 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1838 precursor RNA is designated SEQ ID:1824, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1824 is located at position

131052 relative to the genome of Fowlpox virus.

[25691] VGAM1838 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25692] An enzyme complex designated DICER COMPLEX, dices the VGAM1838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1838 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1838 RNA is designated SEQ ID:4549, and is provided hereinbelow with reference to the sequence listing part.

[25693] VGAM1838 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25694] VGAM1838 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1838 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1838 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25695] The complementary binding of VGAM1838 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1838 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25696] It is appreciated that VGAM1838 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1838 host target genes. The mRNA of each one of this plurality of VGAM1838 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1838 RNA, herein designated VGAM RNA, and which when bound by VGAM1838 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1838 host target proteins.

[25697] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1838 gene, herein designated VGAM GENE, on one or more VGAM1838 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25698] It is yet further appreciated that a function of VGAM1838 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1838 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1838 correlate with, and may be deduced from, the identity of the host target genes which VGAM1838 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25699] Nucleotide sequences of the VGAM1838 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1838 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1838 are further described hereinbelow with reference to Table 1.

[25700] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1838 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25701] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1839 (VGAM1839) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25702] VGAM1839 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1839 was detected is described hereinabove with reference to Figs. 2-8.

[25703] VGAM1839 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM1839 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25704] VGAM1839 gene, herein designated VGAM GENE, encodes a VGAM1839 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1839 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1839 precursor RNA is designated SEQ ID:1825, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1825 is located at position 139769 relative to the genome of Fowlpox virus.

[25705] VGAM1839 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25706] An enzyme complex designated DICER COMPLEX, dices the VGAM1839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1839 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1839 RNA is designated SEQ ID:4550, and is provided hereinbelow with reference to the sequence

listing part.

[25707] VGAM1839 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25708] VGAM1839 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1839 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1839 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25709] The complementary binding of VGAM1839 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1839 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25710] It is appreciated that VGAM1839 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1839 host target genes. The mRNA of each one of this plurality of VGAM1839 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1839 RNA, herein designated VGAM RNA, and which when bound by VGAM1839 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1839 host target proteins.

[25711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1839 gene, herein designated VGAM GENE, on one or more VGAM1839 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25712] It is yet further appreciated that a function of VGAM1839

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1839 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1839 correlate with, and may be deduced from, the identity of the host target genes which VGAM1839 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25713] Nucleotide sequences of the VGAM1839 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1839 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1839 are further described hereinbelow with reference to Table 1.

[25714] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1839 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25715] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1840 (VGAM1840) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25716] VGAM1840 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1840 was detected is described hereinabove with reference to Figs. 2-8.

[25717] VGAM1840 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea mottle virus. VGAM1840 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25718] VGAM1840 gene, herein designated VGAM GENE, encodes a VGAM1840 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1840 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1840 precursor RNA is designated SEQ ID:1826, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1826 is located at position 998 relative to the genome of Cowpea mottle virus.

[25719] VGAM1840 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25720] An enzyme complex designated DICER COMPLEX, dices the VGAM1840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1840 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1840 RNA is designated SEQ ID:4551, and

is provided hereinbelow with reference to the sequence listing part.

[25721] VGAM1840 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25722] VGAM1840 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1840 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1840 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25723] The complementary binding of VGAM1840 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1840 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25724] It is appreciated that VGAM1840 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1840 host target genes. The mRNA of each one of this plurality of VGAM1840 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1840 RNA, herein designated VGAM RNA, and which when bound by VGAM1840 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1840 host target proteins.

[25725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1840 gene, herein designated VGAM GENE, on one or more VGAM1840 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25726] It is yet further appreciated that a function of VGAM1840 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1840 include diagnosis, prevention and treatment of viral infection by Cowpea mottle virus. Specific functions, and accordingly utilities, of VGAM1840 correlate with, and may be deduced from, the identity of the host target genes which VGAM1840 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25727] Nucleotide sequences of the VGAM1840 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1840 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1840 are further described hereinbelow with reference to Table 1.

[25728] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1840 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25729] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1841 (VGAM1841) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25730] VGAM1841 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1841 was detected is described hereinabove with reference to Figs. 2-8.

[25731] VGAM1841 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea mottle virus. VGAM1841 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25732] VGAM1841 gene, herein designated VGAM GENE, encodes a VGAM1841 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1841 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1841 precur-

sor RNA is designated SEQ ID:1827, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1827 is located at position 695 relative to the genome of Cowpea mottle virus.

[25733] VGAM1841 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25734] An enzyme complex designated DICER COMPLEX, dices the VGAM1841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1841 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide se-

quence of VGAM1841 RNA is designated SEQ ID:4552, and is provided hereinbelow with reference to the sequence listing part.

[25735] VGAM1841 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25736] VGAM1841 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1841 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25737] The complementary binding of VGAM1841 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1841 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25738] It is appreciated that VGAM1841 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1841 host target genes. The mRNA of

each one of this plurality of VGAM1841 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1841 RNA, herein designated VGAM RNA, and which when bound by VGAM1841 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1841 host target proteins.

[25739] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1841 gene, herein designated VGAM GENE, on one or more VGAM1841 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[25740] It is yet further appreciated that a function of VGAM1841 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of viral infection by Cowpea mottle virus. Specific functions, and accordingly utilities, of VGAM1841 correlate with, and may be deduced from, the identity of the host target genes which VGAM1841 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25741] Nucleotide sequences of the VGAM1841 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1841 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1841 are further described hereinbelow with reference to Table 1.

[25742] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1841 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[25743] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1842 (VGAM1842) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25744] VGAM1842 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1842 was detected is described hereinabove with reference to Figs. 2-8.

[25745] VGAM1842 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1842 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25746] VGAM1842 gene, herein designated VGAM GENE, encodes a VGAM1842 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1842 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1842 precursor RNA is designated SEQ ID:1828, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1828 is located at position 19726 relative to the genome of Chimpanzee cytomegalovirus.

[25747] VGAM1842 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25748] An enzyme complex designated DICER COMPLEX, dices the VGAM1842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1842 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1842 RNA is designated SEQ ID:4553, and is provided hereinbelow with reference to the sequence listing part.

[25749] VGAM1842 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25750] VGAM1842 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1842 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1842 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25751] The complementary binding of VGAM1842 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1842 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25752] It is appreciated that VGAM1842 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1842 host target genes. The mRNA of each one of this plurality of VGAM1842 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1842 RNA, herein designated VGAM RNA, and which when bound by VGAM1842 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1842 host target proteins.

[25753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1842 gene, herein designated VGAM GENE, on one or more VGAM1842 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25754] It is yet further appreciated that a function of VGAM1842 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1842 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1842 correlate with, and may be deduced from, the identity of the host target genes which VGAM1842 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25755] Nucleotide sequences of the VGAM1842 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1842 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1842 are further described hereinbelow with reference to Table 1.

[25756] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1842 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25757] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1843 (VGAM1843) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25758] VGAM1843 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1843 was detected is described hereinabove with reference to Figs. 2-8.

[25759] VGAM1843 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1843 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25760] VGAM1843 gene, herein designated VGAM GENE, encodes a VGAM1843 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1843 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1843 precursor RNA is designated SEQ ID:1829, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1829 is located at position 14213 relative to the genome of Chimpanzee cytomegalovirus.

[25761] VGAM1843 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25762] An enzyme complex designated DICER COMPLEX, dices the VGAM1843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1843 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1843 RNA is designated SEQ ID:4554, and is provided hereinbelow with reference to the sequence listing part.

[25763] VGAM1843 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25764] VGAM1843 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1843 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25765] The complementary binding of VGAM1843 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1843 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[25766] It is appreciated that VGAM1843 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1843 host target genes. The mRNA of each one of this plurality of VGAM1843 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1843 RNA, herein designated VGAM RNA, and which when bound by VGAM1843 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1843 host target proteins.

[25767] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1843 gene, herein designated VGAM GENE, on one or more VGAM1843 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25768] It is yet further appreciated that a function of VGAM1843 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1843 correlate with, and may be deduced from, the identity of the host target genes which VGAM1843 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25769] Nucleotide sequences of the VGAM1843 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1843 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1843 are further described hereinbelow with reference to Table 1.

[25770] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1843 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25771] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1844 (VGAM1844) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25772] VGAM1844 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1844 was detected is described hereinabove with reference to Figs. 2-8.

[25773] VGAM1844 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1844 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25774] VGAM1844 gene, herein designated VGAM GENE, encodes a VGAM1844 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1844 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1844 precursor RNA is designated SEQ ID:1830, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1830 is located at position 20461 relative to the genome of Chimpanzee cytomegalovirus.

[25775] VGAM1844 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25776] An enzyme complex designated DICER COMPLEX, dices the VGAM1844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1844 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1844 RNA is designated SEQ ID:4555, and is provided hereinbelow with reference to the sequence listing part.

[25777] VGAM1844 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25778] VGAM1844 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1844 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1844 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25779] The complementary binding of VGAM1844 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1844 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1844 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25780] It is appreciated that VGAM1844 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1844 host target genes. The mRNA of each one of this plurality of VGAM1844 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1844 RNA, herein designated VGAM RNA, and which when bound by VGAM1844 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1844 host target proteins.

[25781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1844 gene, herein designated VGAM GENE, on one or more VGAM1844 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25782] It is yet further appreciated that a function of VGAM1844 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1844 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1844 correlate with, and may be deduced from, the identity of the host target genes which VGAM1844 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25783] Nucleotide sequences of the VGAM1844 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1844 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1844 are further

described hereinbelow with reference to Table 1.

[25784] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1844 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25785] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1845 (VGAM1845) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25786] VGAM1845 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1845 was detected is described hereinabove with reference to Figs. 2-8.

[25787] VGAM1845 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1845 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25788] VGAM1845 gene, herein designated VGAM GENE, encodes a VGAM1845 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1845 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1845 precursor RNA is designated SEQ ID:1831, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1831 is located at position 23567 relative to the genome of Chimpanzee cytomegalovirus.

[25789] VGAM1845 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25790] An enzyme complex designated DICER COMPLEX, dices

the VGAM1845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1845 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1845 RNA is designated SEQ ID:4556, and is provided hereinbelow with reference to the sequence listing part.

[25791] VGAM1845 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25792] VGAM1845 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1845 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1845 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25793] The complementary binding of VGAM1845 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1845 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25794] It is appreciated that VGAM1845 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1845 host target genes. The mRNA of each one of this plurality of VGAM1845 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1845 RNA, herein designated VGAM RNA, and which when bound by VGAM1845 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1845 host target proteins.

[25795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1845 gene, herein designated VGAM GENE, on one or more VGAM1845 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25796] It is yet further appreciated that a function of VGAM1845 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1845 correlate with, and may be deduced from, the identity of the host target genes which VGAM1845 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25797] Nucleotide sequences of the VGAM1845 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1845 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1845 are further described hereinbelow with reference to Table 1.

[25798] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1845 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25799] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1846 (VGAM1846) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25800] VGAM1846 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1846 was detected is described hereinabove with reference to Figs. 2-8.

[25801] VGAM1846 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1846 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25802] VGAM1846 gene, herein designated VGAM GENE, encodes a VGAM1846 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1846 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1846 precursor RNA is designated SEQ ID:1832, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1832 is located at position 16140 relative to the genome of Chimpanzee cytomegalovirus.

[25803] VGAM1846 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[25804] An enzyme complex designated DICER COMPLEX, dices the VGAM1846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1846 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1846 RNA is designated SEQ ID:4557, and is provided hereinbelow with reference to the sequence listing part.

[25805] VGAM1846 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25806] VGAM1846 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1846 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1846 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25807] The complementary binding of VGAM1846 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1846 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25808] It is appreciated that VGAM1846 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1846 host target genes. The mRNA of each one of this plurality of VGAM1846 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1846 RNA, herein designated VGAM RNA, and which when bound by VGAM1846 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1846 host target proteins.

[25809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1846 gene, herein designated VGAM GENE, on one or more VGAM1846 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25810] It is yet further appreciated that a function of VGAM1846 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1846 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1846 correlate with, and may be deduced from, the identity of the host target genes which VGAM1846 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25811] Nucleotide sequences of the VGAM1846 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1846 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1846 are further described hereinbelow with reference to Table 1.

[25812] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1846 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25813] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1847 (VGAM1847) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25814] VGAM1847 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1847 was detected is described hereinabove with reference to Figs. 2-8.

[25815] VGAM1847 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Sonchus yellow net virus. VGAM1847 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25816] VGAM1847 gene, herein designated VGAM GENE, encodes a VGAM1847 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1847 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1847 precursor RNA is designated SEQ ID:1833, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1833 is located at position 6650 relative to the genome of Sonchus yellow net virus.

[25817] VGAM1847 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25818] An enzyme complex designated DICER COMPLEX, dices the VGAM1847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1847 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1847 RNA is designated SEQ ID:4558, and is provided hereinbelow with reference to the sequence listing part.

[25819] VGAM1847 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25820] VGAM1847 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1847 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1847 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25821] The complementary binding of VGAM1847 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1847 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25822] It is appreciated that VGAM1847 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1847 host target genes. The mRNA of each one of this plurality of VGAM1847 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1847 RNA, herein designated VGAM RNA, and which when bound by VGAM1847 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1847 host target proteins.

[25823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1847 gene, herein designated VGAM GENE, on one or more VGAM1847 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25824] It is yet further appreciated that a function of VGAM1847 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1847 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM1847 correlate with, and may be deduced from, the identity of the host target genes which VGAM1847 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25825] Nucleotide sequences of the VGAM1847 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1847 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1847 are further described hereinbelow with reference to Table 1.

[25826] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1847 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25827] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1848 (VGAM1848) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25828] VGAM1848 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1848 was detected is described hereinabove with reference to Figs. 2-8.

[25829] VGAM1848 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM1848 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25830] VGAM1848 gene, herein designated VGAM GENE, encodes a VGAM1848 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1848 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1848 precursor RNA is designated SEQ ID:1834, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1834 is located at position 9698 relative to the genome of Sonchus yellow net virus.

[25831] VGAM1848 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25832] An enzyme complex designated DICER COMPLEX, dices the VGAM1848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1848 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1848 RNA is designated SEQ ID:4559, and is provided hereinbelow with reference to the sequence listing part.

[25833] VGAM1848 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[25834] VGAM1848 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1848 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1848 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25835] The complementary binding of VGAM1848 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1848 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25836] It is appreciated that VGAM1848 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1848 host target genes. The mRNA of each one of this plurality of VGAM1848 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1848 RNA, herein designated VGAM RNA, and which when bound by VGAM1848 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1848 host target proteins.

[25837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1848 gene, herein designated VGAM GENE, on one

or more VGAM1848 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25838] It is yet further appreciated that a function of VGAM1848 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1848 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM1848 correlate with, and may be deduced from, the identity of the host target genes which VGAM1848 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25839] Nucleotide sequences of the VGAM1848 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1848 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1848 are further described hereinbelow with reference to Table 1.

[25840] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1848 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25841] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1849 (VGAM1849) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25842] VGAM1849 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1849 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[25843] VGAM1849 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea chlorotic mottle virus. VGAM1849 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25844] VGAM1849 gene, herein designated VGAM GENE, encodes a VGAM1849 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1849 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1849 precursor RNA is designated SEQ ID:1835, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1835 is located at position 1870 relative to the genome of Cowpea chlorotic mottle virus.

[25845] VGAM1849 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25846] An enzyme complex designated DICER COMPLEX, dices the VGAM1849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1849 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1849 RNA is designated SEQ ID:4560, and is provided hereinbelow with reference to the sequence listing part.

[25847] VGAM1849 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25848] VGAM1849 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1849 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[25849] The complementary binding of VGAM1849 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1849 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25850] It is appreciated that VGAM1849 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1849 host target genes. The mRNA of each one of this plurality of VGAM1849 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1849 RNA, herein designated VGAM RNA, and which when bound by VGAM1849 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1849 host target proteins.

[25851] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1849 gene, herein designated VGAM GENE, on one or more VGAM1849 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25852] It is yet further appreciated that a function of VGAM1849 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of viral infection by Cowpea chlorotic mottle virus. Specific functions, and accordingly utilities, of VGAM1849 correlate with, and may be deduced from, the identity of the host target genes which VGAM1849 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[25853] Nucleotide sequences of the VGAM1849 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1849 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1849 are further described hereinbelow with reference to Table 1.

[25854] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1849 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25855] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1850 (VGAM1850) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25856] VGAM1850 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1850 was detected is described hereinabove with reference to Figs. 2-8.

[25857] VGAM1850 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM1850 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25858] VGAM1850 gene, herein designated VGAM GENE, encodes a VGAM1850 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1850 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1850 precursor RNA is designated SEQ ID:1836, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1836 is located at position 1237 relative to the genome of Sonchus yellow net virus.

[25859] VGAM1850 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25860] An enzyme complex designated DICER COMPLEX, dices the VGAM1850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1850 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1850 RNA is designated SEQ ID:4561, and is provided hereinbelow with reference to the sequence listing part.

[25861] VGAM1850 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25862] VGAM1850 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1850 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1850 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25863] The complementary binding of VGAM1850 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1850 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25864] It is appreciated that VGAM1850 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1850 host target genes. The mRNA of each one of this plurality of VGAM1850 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1850 RNA, herein designated VGAM RNA, and which when bound by VGAM1850 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1850 host target proteins.

[25865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1850 gene, herein designated VGAM GENE, on one or more VGAM1850 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25866] It is yet further appreciated that a function of VGAM1850 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1850 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM1850 correlate with, and may be deduced from, the identity of the host target genes which VGAM1850 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[25867] Nucleotide sequences of the VGAM1850 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1850 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1850 are further described hereinbelow with reference to Table 1.

[25868] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1850 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25869] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1851 (VGAM1851) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25870] VGAM1851 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1851 was detected is described hereinabove with reference to Figs. 2-8.

[25871] VGAM1851 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM1851 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25872] VGAM1851 gene, herein designated VGAM GENE, encodes a VGAM1851 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1851 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1851 precursor RNA is designated SEQ ID:1837, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1837 is located at position 6021 relative to the genome of Sonchus yellow net virus.

[25873] VGAM1851 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25874] An enzyme complex designated DICER COMPLEX, dices the VGAM1851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1851 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1851 RNA is designated SEQ ID:4562, and is provided hereinbelow with reference to the sequence listing part.

[25875] VGAM1851 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25876] VGAM1851 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1851 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25877] The complementary binding of VGAM1851 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1851 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25878] It is appreciated that VGAM1851 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1851 host target genes. The mRNA of each one of this plurality of VGAM1851 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1851 RNA, herein designated VGAM RNA, and which when bound by VGAM1851 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1851 host target proteins.

[25879] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1851 gene, herein designated VGAM GENE, on one or more VGAM1851 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25880] It is yet further appreciated that a function of VGAM1851 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM1851 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1851 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25881] Nucleotide sequences of the VGAM1851 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1851 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1851 are further described hereinbelow with reference to Table 1.

[25882] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1851 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25883] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1852 (VGAM1852) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25884] VGAM1852 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1852 was detected is described hereinabove with reference to Figs. 2-8.

[25885] VGAM1852 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM1852 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25886] VGAM1852 gene, herein designated VGAM GENE, encodes a VGAM1852 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1852 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1852 precursor RNA is designated SEQ ID:1838, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1838 is located at position 1792 relative to the genome of Sonchus yellow net virus.

[25887] VGAM1852 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1852 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25888] An enzyme complex designated DICER COMPLEX, dices the VGAM1852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1852 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1852 RNA is designated SEQ ID:4563, and is provided hereinbelow with reference to the sequence listing part.

[25889] VGAM1852 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1852 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1852 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25890] VGAM1852 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1852 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1852 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1852 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1852 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25891] The complementary binding of VGAM1852 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1852 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1852 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1852 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25892] It is appreciated that VGAM1852 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1852 host target genes. The mRNA of each one of this plurality of VGAM1852 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1852 RNA, herein designated VGAM RNA, and which when bound by VGAM1852 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1852 host target proteins.

[25893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1852 gene, herein designated VGAM GENE, on one or more VGAM1852 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25894] It is yet further appreciated that a function of VGAM1852 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM1852

correlate with, and may be deduced from, the identity of the host target genes which VGAM1852 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25895] Nucleotide sequences of the VGAM1852 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1852 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1852 are further described hereinbelow with reference to Table 1.

[25896] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1852 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25897] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1853 (VGAM1853) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[25898] VGAM1853 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1853 was detected is described hereinabove with reference to Figs. 2-8.

[25899] VGAM1853 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM1853 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25900] VGAM1853 gene, herein designated VGAM GENE, encodes a VGAM1853 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1853 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1853 precursor RNA is designated SEQ ID:1839, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1839 is located at position 3373 relative to the genome of Sonchus yellow net virus.

[25901] VGAM1853 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1853 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25902] An enzyme complex designated DICER COMPLEX, dices the VGAM1853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1853 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1853 RNA is designated SEQ ID:4564, and is provided hereinbelow with reference to the sequence listing part.

[25903] VGAM1853 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1853 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25904] VGAM1853 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1853 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25905] The complementary binding of VGAM1853 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1853 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25906] It is appreciated that VGAM1853 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1853 host target genes. The mRNA of each one of this plurality of VGAM1853 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1853 RNA, herein designated VGAM RNA, and which when bound by VGAM1853 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1853 host target proteins.

[25907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1853 gene, herein designated VGAM GENE, on one or more VGAM1853 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25908] It is yet further appreciated that a function of VGAM1853 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus.

Specific functions, and accordingly utilities, of VGAM1853 correlate with, and may be deduced from, the identity of the host target genes which VGAM1853 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25909] Nucleotide sequences of the VGAM1853 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1853 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1853 are further described hereinbelow with reference to Table 1.

[25910] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1853 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25911] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1854 (VGAM1854) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[25912] VGAM1854 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1854 was detected is described hereinabove with reference to Figs. 2-8.

[25913] VGAM1854 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea chlorotic mottle virus. VGAM1854 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25914] VGAM1854 gene, herein designated VGAM GENE, encodes a VGAM1854 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1854 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1854 precursor RNA is designated SEQ ID:1840, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1840 is located at position 1253 relative to the genome of Cowpea chlorotic mottle virus.

[25915] VGAM1854 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25916] An enzyme complex designated DICER COMPLEX, dices the VGAM1854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1854 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1854 RNA is designated SEQ ID:4565, and is provided hereinbelow with reference to the sequence listing part.

[25917] VGAM1854 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25918] VGAM1854 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1854 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1854 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1854 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25919] The complementary binding of VGAM1854 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1854 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25920] It is appreciated that VGAM1854 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1854 host target genes. The mRNA of each one of this plurality of VGAM1854 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1854 RNA, herein designated VGAM RNA, and which when bound by VGAM1854 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1854 host target proteins.

[25921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1854 gene, herein designated VGAM GENE, on one or more VGAM1854 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25922] It is yet further appreciated that a function of VGAM1854 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1854 include diagnosis, prevention and

treatment of viral infection by Cowpea chlorotic mottle virus. Specific functions, and accordingly utilities, of VGAM1854 correlate with, and may be deduced from, the identity of the host target genes which VGAM1854 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25923] Nucleotide sequences of the VGAM1854 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1854 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1854 are further described hereinbelow with reference to Table 1.

[25924] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1854 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25925] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1855 (VGAM1855) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25926] VGAM1855 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1855 was detected is described hereinabove with reference to Figs. 2-8.

[25927] VGAM1855 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM1855 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25928] VGAM1855 gene, herein designated VGAM GENE, encodes a VGAM1855 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1855 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1855 precursor RNA is designated SEQ ID:1841, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1841 is located at position 8120 relative to the genome of Sonchus yellow net virus.

[25929] VGAM1855 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25930] An enzyme complex designated DICER COMPLEX, dices the VGAM1855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1855 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1855 RNA is designated SEQ ID:4566, and is provided hereinbelow with reference to the sequence listing part.

[25931] VGAM1855 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25932] VGAM1855 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1855 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1855 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25933] The complementary binding of VGAM1855 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1855 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25934] It is appreciated that VGAM1855 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1855 host target genes. The mRNA of each one of this plurality of VGAM1855 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1855 RNA, herein designated VGAM

RNA, and which when bound by VGAM1855 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1855 host target proteins.

[25935] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1855 gene, herein designated VGAM GENE, on one or more VGAM1855 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25936] It is yet further appreciated that a function of VGAM1855 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1855 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM1855 correlate with, and may be deduced from, the identity of the host target genes which VGAM1855 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25937] Nucleotide sequences of the VGAM1855 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1855 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1855 are further described hereinbelow with reference to Table 1.

[25938] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1855 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25939] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1856 (VGAM1856) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25940] VGAM1856 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1856 was detected is described hereinabove with reference to Figs. 2-8.

[25941] VGAM1856 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM1856 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25942] VGAM1856 gene, herein designated VGAM GENE, encodes a VGAM1856 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1856 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1856 precursor RNA is designated SEQ ID:1842, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1842 is located at position

13503 relative to the genome of Rice yellow stunt virus.

[25943] VGAM1856 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25944] An enzyme complex designated DICER COMPLEX, dices the VGAM1856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1856 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1856 RNA is designated SEQ ID:4567, and is provided hereinbelow with reference to the sequence listing part.

[25945] VGAM1856 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25946] VGAM1856 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1856 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1856 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25947] The complementary binding of VGAM1856 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1856 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25948] It is appreciated that VGAM1856 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1856 host target genes. The mRNA of each one of this plurality of VGAM1856 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1856 RNA, herein designated VGAM RNA, and which when bound by VGAM1856 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1856 host target proteins.

[25949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1856 gene, herein designated VGAM GENE, on one or more VGAM1856 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25950] It is yet further appreciated that a function of VGAM1856 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1856 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM1856 correlate with, and may be deduced from, the identity of the host target genes which VGAM1856 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25951] Nucleotide sequences of the VGAM1856 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1856 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1856 are further described hereinbelow with reference to Table 1.

[25952] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1856 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25953] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1857 (VGAM1857) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25954] VGAM1857 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1857 was detected is described hereinabove with reference to Figs. 2-8.

[25955] VGAM1857 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM1857 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25956] VGAM1857 gene, herein designated VGAM GENE, encodes a VGAM1857 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1857 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1857 precursor RNA is designated SEQ ID:1843, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1843 is located at position 9634 relative to the genome of Rice yellow stunt virus.

[25957] VGAM1857 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25958] An enzyme complex designated DICER COMPLEX, dices the VGAM1857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1857 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1857 RNA is designated SEQ ID:4568, and is provided hereinbelow with reference to the sequence

listing part.

[25959] VGAM1857 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25960] VGAM1857 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1857 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1857 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25961] The complementary binding of VGAM1857 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1857 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25962] It is appreciated that VGAM1857 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1857 host target genes. The mRNA of each one of this plurality of VGAM1857 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1857 RNA, herein designated VGAM RNA, and which when bound by VGAM1857 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1857 host target proteins.

[25963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1857 gene, herein designated VGAM GENE, on one or more VGAM1857 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25964] It is yet further appreciated that a function of VGAM1857

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1857 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM1857 correlate with, and may be deduced from, the identity of the host target genes which VGAM1857 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25965] Nucleotide sequences of the VGAM1857 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1857 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1857 are further described hereinbelow with reference to Table 1.

[25966] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1857 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25967] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1858 (VGAM1858) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25968] VGAM1858 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1858 was detected is described hereinabove with reference to Figs. 2-8.

[25969] VGAM1858 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM1858 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25970] VGAM1858 gene, herein designated VGAM GENE, encodes a VGAM1858 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1858 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1858 precursor RNA is designated SEQ ID:1844, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1844 is located at position 4741 relative to the genome of Rice yellow stunt virus.

[25971] VGAM1858 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25972] An enzyme complex designated DICER COMPLEX, dices the VGAM1858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1858 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1858 RNA is designated SEQ ID:4569, and

is provided hereinbelow with reference to the sequence listing part.

[25973] VGAM1858 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25974] VGAM1858 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1858 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25975] The complementary binding of VGAM1858 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1858 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25976] It is appreciated that VGAM1858 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1858 host target genes. The mRNA of each one of this plurality of VGAM1858 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1858 RNA, herein designated VGAM RNA, and which when bound by VGAM1858 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1858 host target proteins.

[25977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1858 gene, herein designated VGAM GENE, on one or more VGAM1858 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25978] It is yet further appreciated that a function of VGAM1858 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM1858 correlate with, and may be deduced from, the identity of the host target genes which VGAM1858 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25979] Nucleotide sequences of the VGAM1858 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1858 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1858 are further described hereinbelow with reference to Table 1.

[25980] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1858 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25981] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1859 (VGAM1859) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25982] VGAM1859 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1859 was detected is described hereinabove with reference to Figs. 2-8.

[25983] VGAM1859 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM1859 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25984] VGAM1859 gene, herein designated VGAM GENE, encodes a VGAM1859 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1859 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1859 precur-

sor RNA is designated SEQ ID:1845, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1845 is located at position 3094 relative to the genome of Rice yellow stunt virus.

[25985] VGAM1859 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25986] An enzyme complex designated DICER COMPLEX, dices the VGAM1859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1859 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide se-

quence of VGAM1859 RNA is designated SEQ ID:4570, and is provided hereinbelow with reference to the sequence listing part.

[25987] VGAM1859 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25988] VGAM1859 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1859 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25989] The complementary binding of VGAM1859 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1859 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25990] It is appreciated that VGAM1859 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1859 host target genes. The mRNA of

each one of this plurality of VGAM1859 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1859 RNA, herein designated VGAM RNA, and which when bound by VGAM1859 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1859 host target proteins.

[25991] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1859 gene, herein designated VGAM GENE, on one or more VGAM1859 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[25992] It is yet further appreciated that a function of VGAM1859 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM1859 correlate with, and may be deduced from, the identity of the host target genes which VGAM1859 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25993] Nucleotide sequences of the VGAM1859 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1859 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1859 are further described hereinbelow with reference to Table 1.

[25994] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1859 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[25995] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1860 (VGAM1860) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25996] VGAM1860 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1860 was detected is described hereinabove with reference to Figs. 2-8.

[25997] VGAM1860 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM1860 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25998] VGAM1860 gene, herein designated VGAM GENE, encodes a VGAM1860 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1860 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1860 precursor RNA is designated SEQ ID:1846, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1846 is located at position 9805 relative to the genome of Rice yellow stunt virus.

[25999] VGAM1860 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26000] An enzyme complex designated DICER COMPLEX, dices the VGAM1860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1860 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1860 RNA is designated SEQ ID:4571, and is provided hereinbelow with reference to the sequence listing part.

[26001] VGAM1860 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26002] VGAM1860 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1860 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26003] The complementary binding of VGAM1860 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1860 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26004] It is appreciated that VGAM1860 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1860 host target genes. The mRNA of each one of this plurality of VGAM1860 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1860 RNA, herein designated VGAM RNA, and which when bound by VGAM1860 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1860 host target proteins.

[26005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1860 gene, herein designated VGAM GENE, on one or more VGAM1860 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26006] It is yet further appreciated that a function of VGAM1860 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM1860 correlate with, and may be deduced from, the identity of the host target genes which VGAM1860 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26007] Nucleotide sequences of the VGAM1860 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1860 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1860 are further described hereinbelow with reference to Table 1.

[26008] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1860 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26009] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1861 (VGAM1861) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26010] VGAM1861 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1861 was detected is described hereinabove with reference to Figs. 2-8.

[26011] VGAM1861 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM1861 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26012] VGAM1861 gene, herein designated VGAM GENE, encodes a VGAM1861 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1861 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1861 precursor RNA is designated SEQ ID:1847, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1847 is located at position 11283 relative to the genome of Rice yellow stunt virus.

[26013] VGAM1861 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26014] An enzyme complex designated DICER COMPLEX, dices the VGAM1861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1861 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1861 RNA is designated SEQ ID:4572, and is provided hereinbelow with reference to the sequence listing part.

[26015] VGAM1861 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26016] VGAM1861 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1861 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1861 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26017] The complementary binding of VGAM1861 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1861 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26018] It is appreciated that VGAM1861 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1861 host target genes. The mRNA of each one of this plurality of VGAM1861 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1861 RNA, herein designated VGAM RNA, and which when bound by VGAM1861 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1861 host target proteins.

[26019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1861 gene, herein designated VGAM GENE, on one or more VGAM1861 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26020] It is yet further appreciated that a function of VGAM1861 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1861 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM1861 correlate with, and may be deduced from, the identity of the host target genes which VGAM1861 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26021] Nucleotide sequences of the VGAM1861 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1861 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1861 are further described hereinbelow with reference to Table 1.

[26022] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1861 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26023] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1862 (VGAM1862) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26024] VGAM1862 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1862 was detected is described hereinabove with reference to Figs. 2-8.

[26025] VGAM1862 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lactate dehydrogenase-elevating virus. VGAM1862 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26026] VGAM1862 gene, herein designated VGAM GENE, encodes a VGAM1862 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1862 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1862 precursor RNA is designated SEQ ID:1848, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1848 is located at position 5398 relative to the genome of Lactate dehydrogenase-elevating virus.

[26027] VGAM1862 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26028] An enzyme complex designated DICER COMPLEX, dices the VGAM1862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1862 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1862 RNA is designated SEQ ID:4573, and is provided hereinbelow with reference to the sequence listing part.

[26029] VGAM1862 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26030] VGAM1862 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1862 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26031] The complementary binding of VGAM1862 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1862 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[26032] It is appreciated that VGAM1862 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1862 host target genes. The mRNA of each one of this plurality of VGAM1862 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1862 RNA, herein designated VGAM RNA, and which when bound by VGAM1862 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1862 host target proteins.

[26033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1862 gene, herein designated VGAM GENE, on one or more VGAM1862 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26034] It is yet further appreciated that a function of VGAM1862 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of viral infection by Lactate dehydrogenase-elevating virus. Specific functions, and accordingly utilities, of VGAM1862 correlate with, and may be deduced from, the identity of the host target genes which VGAM1862 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26035] Nucleotide sequences of the VGAM1862 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1862 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1862 are further described hereinbelow with reference to Table 1.

[26036] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1862 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26037] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1863 (VGAM1863) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26038] VGAM1863 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1863 was detected is described hereinabove with reference to Figs. 2-8.

[26039] VGAM1863 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine herpesvirus 3. VGAM1863 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26040] VGAM1863 gene, herein designated VGAM GENE, encodes a VGAM1863 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1863 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1863 precursor RNA is designated SEQ ID:1849, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1849 is located at position 121675 relative to the genome of Callitrichine herpesvirus 3.

[26041] VGAM1863 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26042] An enzyme complex designated DICER COMPLEX, dices the VGAM1863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1863 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1863 RNA is designated SEQ ID:4574, and is provided hereinbelow with reference to the sequence listing part.

[26043] VGAM1863 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26044] VGAM1863 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1863 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26045] The complementary binding of VGAM1863 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1863 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1863 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26046] It is appreciated that VGAM1863 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1863 host target genes. The mRNA of each one of this plurality of VGAM1863 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1863 RNA, herein designated VGAM RNA, and which when bound by VGAM1863 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1863 host target proteins.

[26047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1863 gene, herein designated VGAM GENE, on one or more VGAM1863 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26048] It is yet further appreciated that a function of VGAM1863 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of viral infection by Callitrichine herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1863 correlate with, and may be deduced from, the identity of the host target genes which VGAM1863 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26049] Nucleotide sequences of the VGAM1863 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1863 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1863 are further

described hereinbelow with reference to Table 1.

[26050] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1863 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26051] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1864 (VGAM1864) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26052] VGAM1864 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1864 was detected is described hereinabove with reference to Figs. 2-8.

[26053] VGAM1864 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine herpesvirus 3. VGAM1864 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26054] VGAM1864 gene, herein designated VGAM GENE, encodes a VGAM1864 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1864 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1864 precursor RNA is designated SEQ ID:1850, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1850 is located at position 121062 relative to the genome of Callitrichine herpesvirus 3.

[26055] VGAM1864 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26056] An enzyme complex designated DICER COMPLEX, dices

the VGAM1864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1864 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM1864 RNA is designated SEQ ID:4575, and is provided hereinbelow with reference to the sequence listing part.

[26057] VGAM1864 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26058] VGAM1864 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1864 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1864 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26059] The complementary binding of VGAM1864 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1864 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26060] It is appreciated that VGAM1864 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1864 host target genes. The mRNA of each one of this plurality of VGAM1864 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1864 RNA, herein designated VGAM RNA, and which when bound by VGAM1864 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1864 host target proteins.

[26061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1864 gene, herein designated VGAM GENE, on one or more VGAM1864 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26062] It is yet further appreciated that a function of VGAM1864 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of viral infection by Callitrichine herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1864 correlate with, and may be deduced from, the identity of the host target genes which VGAM1864 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26063] Nucleotide sequences of the VGAM1864 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1864 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1864 are further described hereinbelow with reference to Table 1.

[26064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1864 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26065] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1865 (VGAM1865) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26066] VGAM1865 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1865 was detected is described hereinabove with reference to Figs. 2-8.

[26067] VGAM1865 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine herpesvirus 3. VGAM1865 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[26068] VGAM1865 gene, herein designated VGAM GENE, encodes a VGAM1865 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1865 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1865 precursor RNA is designated SEQ ID:1851, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1851 is located at position 122877 relative to the genome of Callitrichine herpesvirus 3.

[26069] VGAM1865 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[26070] An enzyme complex designated DICER COMPLEX, dices the VGAM1865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1865 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1865 RNA is designated SEQ ID:4576, and is provided hereinbelow with reference to the sequence listing part.

[26071] VGAM1865 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26072] VGAM1865 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1865 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26073] The complementary binding of VGAM1865 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1865 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26074] It is appreciated that VGAM1865 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1865 host target genes. The mRNA of each one of this plurality of VGAM1865 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1865 RNA, herein designated VGAM RNA, and which when bound by VGAM1865 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1865 host target proteins.

[26075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1865 gene, herein designated VGAM GENE, on one or more VGAM1865 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26076] It is yet further appreciated that a function of VGAM1865 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of viral infection by Callitrichine herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1865 correlate with, and may be deduced from, the identity of the host target genes which VGAM1865 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26077] Nucleotide sequences of the VGAM1865 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1865 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1865 are further described hereinbelow with reference to Table 1.

[26078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1865 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26079] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1866 (VGAM1866) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26080] VGAM1866 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1866 was detected is described hereinabove with reference to Figs. 2-8.

[26081] VGAM1866 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Callitrichine herpesvirus 3. VGAM1866 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26082] VGAM1866 gene, herein designated VGAM GENE, encodes a VGAM1866 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1866 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1866 precursor RNA is designated SEQ ID:1852, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1852 is located at position 121344 relative to the genome of Callitrichine herpesvirus 3.

[26083] VGAM1866 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26084] An enzyme complex designated DICER COMPLEX, dices the VGAM1866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1866 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1866 RNA is designated SEQ ID:4577, and is provided hereinbelow with reference to the sequence listing part.

[26085] VGAM1866 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[26086] VGAM1866 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1866 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26087] The complementary binding of VGAM1866 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1866 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26088] It is appreciated that VGAM1866 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1866 host target genes. The mRNA of each one of this plurality of VGAM1866 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1866 RNA, herein designated VGAM RNA, and which when bound by VGAM1866 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1866 host target proteins.

[26089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1866 gene, herein designated VGAM GENE, on one

or more VGAM1866 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26090] It is yet further appreciated that a function of VGAM1866 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of viral infection by Callitrichine herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1866 correlate with, and may be deduced from, the identity of the host target genes which VGAM1866 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26091] Nucleotide sequences of the VGAM1866 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1866 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1866 are further described hereinbelow with reference to Table 1.

[26092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1866 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26093] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1867 (VGAM1867) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26094] VGAM1867 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1867 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[26095] VGAM1867 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine herpesvirus 3. VGAM1867 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26096] VGAM1867 gene, herein designated VGAM GENE, encodes a VGAM1867 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1867 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1867 precursor RNA is designated SEQ ID:1853, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1853 is located at position 121561 relative to the genome of Callitrichine herpesvirus 3.

[26097] VGAM1867 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26098] An enzyme complex designated DICER COMPLEX, dices the VGAM1867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1867 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1867 RNA is designated SEQ ID:4578, and is provided hereinbelow with reference to the sequence listing part.

[26099] VGAM1867 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26100] VGAM1867 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1867 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26101] The complementary binding of VGAM1867 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1867 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26102] It is appreciated that VGAM1867 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1867 host target genes. The mRNA of each one of this plurality of VGAM1867 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1867 RNA, herein designated VGAM RNA, and which when bound by VGAM1867 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1867 host target proteins.

[26103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1867 gene, herein designated VGAM GENE, on one or more VGAM1867 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26104] It is yet further appreciated that a function of VGAM1867 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of viral infection by Callitrichine herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1867 correlate with, and may be deduced from, the identity of the host target genes which VGAM1867 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[26105] Nucleotide sequences of the VGAM1867 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1867 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1867 are further described hereinbelow with reference to Table 1.

[26106] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1867 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26107] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1868 (VGAM1868) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26108] VGAM1868 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1868 was detected is described hereinabove with reference to Figs. 2-8.

[26109] VGAM1868 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine herpesvirus 3. VGAM1868 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26110] VGAM1868 gene, herein designated VGAM GENE, encodes a VGAM1868 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1868 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1868 precursor RNA is designated SEQ ID:1854, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1854 is located at position 119545 relative to the genome of Callitrichine herpesvirus 3.

[26111] VGAM1868 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1868 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26112] An enzyme complex designated DICER COMPLEX, dices the VGAM1868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1868 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1868 RNA is designated SEQ ID:4579, and is provided hereinbelow with reference to the sequence listing part.

[26113] VGAM1868 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1868 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26114] VGAM1868 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1868 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26115] The complementary binding of VGAM1868 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1868 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26116] It is appreciated that VGAM1868 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1868 host target genes. The mRNA of each one of this plurality of VGAM1868 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1868 RNA, herein designated VGAM RNA, and which when bound by VGAM1868 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1868 host target proteins.

[26117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1868 gene, herein designated VGAM GENE, on one or more VGAM1868 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26118] It is yet further appreciated that a function of VGAM1868 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of viral infection by Callitrichine herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1868

correlate with, and may be deduced from, the identity of the host target genes which VGAM1868 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26119] Nucleotide sequences of the VGAM1868 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1868 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1868 are further described hereinbelow with reference to Table 1.

[26120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1868 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26121] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1869 (VGAM1869) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[26122] VGAM1869 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1869 was detected is described hereinabove with reference to Figs. 2-8.

[26123] VGAM1869 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1869 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26124] VGAM1869 gene, herein designated VGAM GENE, encodes a VGAM1869 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1869 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1869 precursor RNA is designated SEQ ID:1855, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1855 is located at position 125161 relative to the genome of Equine herpesvirus 2.

[26125] VGAM1869 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1869 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26126] An enzyme complex designated DICER COMPLEX, dices the VGAM1869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1869 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1869 RNA is designated SEQ ID:4580, and is provided hereinbelow with reference to the sequence listing part.

[26127] VGAM1869 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1869 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26128] VGAM1869 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1869 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26129] The complementary binding of VGAM1869 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1869 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26130] It is appreciated that VGAM1869 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1869 host target genes. The mRNA of each one of this plurality of VGAM1869 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1869 RNA, herein designated VGAM RNA, and which when bound by VGAM1869 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1869 host target proteins.

[26131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1869 gene, herein designated VGAM GENE, on one or more VGAM1869 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26132] It is yet further appreciated that a function of VGAM1869 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM1869 correlate with, and may be deduced from, the identity of the host target genes which VGAM1869 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26133] Nucleotide sequences of the VGAM1869 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1869 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1869 are further described hereinbelow with reference to Table 1.

[26134] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1869 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26135] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1870 (VGAM1870) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[26136] VGAM1870 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1870 was detected is described hereinabove with reference to Figs. 2-8.

[26137] VGAM1870 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1870 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26138] VGAM1870 gene, herein designated VGAM GENE, encodes a VGAM1870 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1870 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1870 precursor RNA is designated SEQ ID:1856, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1856 is located at position 190565 relative to the genome of Fowlpox virus.

[26139] VGAM1870 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26140] An enzyme complex designated DICER COMPLEX, dices the VGAM1870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1870 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1870 RNA is designated SEQ ID:4581, and is provided hereinbelow with reference to the sequence listing part.

[26141] VGAM1870 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26142] VGAM1870 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1870 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1870 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1870 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26143] The complementary binding of VGAM1870 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1870 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26144] It is appreciated that VGAM1870 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1870 host target genes. The mRNA of each one of this plurality of VGAM1870 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1870 RNA, herein designated VGAM RNA, and which when bound by VGAM1870 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1870 host target proteins.

[26145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1870 gene, herein designated VGAM GENE, on one or more VGAM1870 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26146] It is yet further appreciated that a function of VGAM1870 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1870 include diagnosis, prevention and

treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1870 correlate with, and may be deduced from, the identity of the host target genes which VGAM1870 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26147] Nucleotide sequences of the VGAM1870 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1870 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1870 are further described hereinbelow with reference to Table 1.

[26148] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1870 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26149] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1871 (VGAM1871) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26150] VGAM1871 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1871 was detected is described hereinabove with reference to Figs. 2-8.

[26151] VGAM1871 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1871 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26152] VGAM1871 gene, herein designated VGAM GENE, encodes a VGAM1871 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1871 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1871 precursor RNA is designated SEQ ID:1857, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1857 is located at position 195331 relative to the genome of Fowlpox virus.

[26153] VGAM1871 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26154] An enzyme complex designated DICER COMPLEX, dices the VGAM1871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1871 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1871 RNA is designated SEQ ID:4582, and is provided hereinbelow with reference to the sequence listing part.

[26155] VGAM1871 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26156] VGAM1871 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1871 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1871 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26157] The complementary binding of VGAM1871 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1871 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26158] It is appreciated that VGAM1871 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1871 host target genes. The mRNA of each one of this plurality of VGAM1871 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1871 RNA, herein designated VGAM

RNA, and which when bound by VGAM1871 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1871 host target proteins.

[26159] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1871 gene, herein designated VGAM GENE, on one or more VGAM1871 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26160] It is yet further appreciated that a function of VGAM1871 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1871 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1871 correlate with, and may be deduced from, the identity of the host target genes which VGAM1871 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26161] Nucleotide sequences of the VGAM1871 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1871 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1871 are further described hereinbelow with reference to Table 1.

[26162] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1871 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26163] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1872 (VGAM1872) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26164] VGAM1872 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1872 was detected is described hereinabove with reference to Figs. 2-8.

[26165] VGAM1872 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1872 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26166] VGAM1872 gene, herein designated VGAM GENE, encodes a VGAM1872 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1872 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1872 precursor RNA is designated SEQ ID:1858, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1858 is located at position

190660 relative to the genome of Fowlpox virus.

[26167] VGAM1872 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26168] An enzyme complex designated DICER COMPLEX, dices the VGAM1872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1872 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1872 RNA is designated SEQ ID:4583, and is provided hereinbelow with reference to the sequence listing part.

[26169] VGAM1872 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26170] VGAM1872 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1872 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1872 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26171] The complementary binding of VGAM1872 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1872 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26172] It is appreciated that VGAM1872 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1872 host target genes. The mRNA of each one of this plurality of VGAM1872 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1872 RNA, herein designated VGAM RNA, and which when bound by VGAM1872 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1872 host target proteins.

[26173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1872 gene, herein designated VGAM GENE, on one or more VGAM1872 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26174] It is yet further appreciated that a function of VGAM1872 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1872 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1872 correlate with, and may be deduced from, the identity of the host target genes which VGAM1872 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26175] Nucleotide sequences of the VGAM1872 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1872 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1872 are further described hereinbelow with reference to Table 1.

[26176] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1872 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26177] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1873 (VGAM1873) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26178] VGAM1873 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1873 was detected is described hereinabove with reference to Figs. 2-8.

[26179] VGAM1873 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1873 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26180] VGAM1873 gene, herein designated VGAM GENE, encodes a VGAM1873 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1873 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1873 precursor RNA is designated SEQ ID:1859, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1859 is located at position 188015 relative to the genome of Fowlpox virus.

[26181] VGAM1873 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26182] An enzyme complex designated DICER COMPLEX, dices the VGAM1873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1873 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM1873 RNA is designated SEQ ID:4584, and is provided hereinbelow with reference to the sequence

listing part.

[26183] VGAM1873 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26184] VGAM1873 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1873 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26185] The complementary binding of VGAM1873 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1873 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26186] It is appreciated that VGAM1873 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1873 host target genes. The mRNA of each one of this plurality of VGAM1873 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1873 RNA, herein designated VGAM RNA, and which when bound by VGAM1873 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1873 host target proteins.

[26187] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1873 gene, herein designated VGAM GENE, on one or more VGAM1873 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26188] It is yet further appreciated that a function of VGAM1873

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1873 correlate with, and may be deduced from, the identity of the host target genes which VGAM1873 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26189] Nucleotide sequences of the VGAM1873 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1873 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1873 are further described hereinbelow with reference to Table 1.

[26190] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1873 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26191] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1874 (VGAM1874) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26192] VGAM1874 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1874 was detected is described hereinabove with reference to Figs. 2-8.

[26193] VGAM1874 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1874 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26194] VGAM1874 gene, herein designated VGAM GENE, encodes a VGAM1874 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1874 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1874 precursor RNA is designated SEQ ID:1860, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1860 is located at position 196857 relative to the genome of Fowlpox virus.

[26195] VGAM1874 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26196] An enzyme complex designated DICER COMPLEX, dices the VGAM1874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1874 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1874 RNA is designated SEQ ID:4585, and

is provided hereinbelow with reference to the sequence listing part.

[26197] VGAM1874 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26198] VGAM1874 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1874 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26199] The complementary binding of VGAM1874 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1874 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26200] It is appreciated that VGAM1874 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1874 host target genes. The mRNA of each one of this plurality of VGAM1874 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1874 RNA, herein designated VGAM RNA, and which when bound by VGAM1874 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1874 host target proteins.

[26201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1874 gene, herein designated VGAM GENE, on one or more VGAM1874 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26202] It is yet further appreciated that a function of VGAM1874 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1874 correlate with, and may be deduced from, the identity of the host target genes which VGAM1874 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26203] Nucleotide sequences of the VGAM1874 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1874 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1874 are further described hereinbelow with reference to Table 1.

[26204] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1874 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26205] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1875 (VGAM1875) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26206] VGAM1875 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1875 was detected is described hereinabove with reference to Figs. 2-8.

[26207] VGAM1875 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM1875 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26208] VGAM1875 gene, herein designated VGAM GENE, encodes a VGAM1875 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1875 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1875 precur-

sor RNA is designated SEQ ID:1861, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1861 is located at position 187831 relative to the genome of Fowlpox virus.

[26209] VGAM1875 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26210] An enzyme complex designated DICER COMPLEX, dices the VGAM1875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1875 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide se-

quence of VGAM1875 RNA is designated SEQ ID:4586, and is provided hereinbelow with reference to the sequence listing part.

[26211] VGAM1875 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26212] VGAM1875 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1875 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26213] The complementary binding of VGAM1875 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1875 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26214] It is appreciated that VGAM1875 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1875 host target genes. The mRNA of

each one of this plurality of VGAM1875 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1875 RNA, herein designated VGAM RNA, and which when bound by VGAM1875 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1875 host target proteins.

[26215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1875 gene, herein designated VGAM GENE, on one or more VGAM1875 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[26216] It is yet further appreciated that a function of VGAM1875 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1875 correlate with, and may be deduced from, the identity of the host target genes which VGAM1875 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26217] Nucleotide sequences of the VGAM1875 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1875 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1875 are further described hereinbelow with reference to Table 1.

[26218] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1875 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[26219] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1876 (VGAM1876) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26220] VGAM1876 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1876 was detected is described hereinabove with reference to Figs. 2-8.

[26221] VGAM1876 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1876 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26222] VGAM1876 gene, herein designated VGAM GENE, encodes a VGAM1876 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1876 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1876 precursor RNA is designated SEQ ID:1862, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1862 is located at position 194761 relative to the genome of Fowlpox virus.

[26223] VGAM1876 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26224] An enzyme complex designated DICER COMPLEX, dices the VGAM1876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1876 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1876 RNA is designated SEQ ID:4587, and is provided hereinbelow with reference to the sequence listing part.

[26225] VGAM1876 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26226] VGAM1876 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1876 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26227] The complementary binding of VGAM1876 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1876 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26228] It is appreciated that VGAM1876 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1876 host target genes. The mRNA of each one of this plurality of VGAM1876 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1876 RNA, herein designated VGAM RNA, and which when bound by VGAM1876 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1876 host target proteins.

[26229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1876 gene, herein designated VGAM GENE, on one or more VGAM1876 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26230] It is yet further appreciated that a function of VGAM1876 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1876 correlate with, and may be deduced from, the identity of the host target genes which VGAM1876 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26231] Nucleotide sequences of the VGAM1876 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1876 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1876 are further described hereinbelow with reference to Table 1.

[26232] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1876 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26233] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1877 (VGAM1877) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26234] VGAM1877 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1877 was detected is described hereinabove with reference to Figs. 2-8.

[26235] VGAM1877 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1877 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26236] VGAM1877 gene, herein designated VGAM GENE, encodes a VGAM1877 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1877 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1877 precursor RNA is designated SEQ ID:1863, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1863 is located at position 184855 relative to the genome of Fowlpox virus.

[26237] VGAM1877 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26238] An enzyme complex designated DICER COMPLEX, dices the VGAM1877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1877 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1877 RNA is designated SEQ ID:4588, and is provided hereinbelow with reference to the sequence listing part.

[26239] VGAM1877 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26240] VGAM1877 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1877 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26241] The complementary binding of VGAM1877 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1877 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26242] It is appreciated that VGAM1877 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1877 host target genes. The mRNA of each one of this plurality of VGAM1877 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1877 RNA, herein designated VGAM RNA, and which when bound by VGAM1877 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1877 host target proteins.

[26243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1877 gene, herein designated VGAM GENE, on one or more VGAM1877 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26244] It is yet further appreciated that a function of VGAM1877 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1877 correlate with, and may be deduced from, the identity of the host target genes which VGAM1877 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26245] Nucleotide sequences of the VGAM1877 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1877 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1877 are further described hereinbelow with reference to Table 1.

[26246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1877 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26247] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1878 (VGAM1878) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26248] VGAM1878 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1878 was detected is described hereinabove with reference to Figs. 2-8.

[26249] VGAM1878 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM1878 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26250] VGAM1878 gene, herein designated VGAM GENE, encodes a VGAM1878 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1878 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1878 precursor RNA is designated SEQ ID:1864, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1864 is located at position 7295 relative to the genome of Bovine respiratory syncytial virus.

[26251] VGAM1878 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26252] An enzyme complex designated DICER COMPLEX, dices the VGAM1878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1878 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1878 RNA is designated SEQ ID:4589, and is provided hereinbelow with reference to the sequence listing part.

[26253] VGAM1878 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26254] VGAM1878 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1878 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1878 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26255] The complementary binding of VGAM1878 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1878 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[26256] It is appreciated that VGAM1878 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1878 host target genes. The mRNA of each one of this plurality of VGAM1878 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1878 RNA, herein designated VGAM RNA, and which when bound by VGAM1878 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1878 host target proteins.

[26257] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1878 gene, herein designated VGAM GENE, on one or more VGAM1878 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26258] It is yet further appreciated that a function of VGAM1878 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1878 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1878 correlate with, and may be deduced from, the identity of the host target genes which VGAM1878 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26259] Nucleotide sequences of the VGAM1878 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1878 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1878 are further described hereinbelow with reference to Table 1.

[26260] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1878 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26261] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1879 (VGAM1879) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26262] VGAM1879 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1879 was detected is described hereinabove with reference to Figs. 2-8.

[26263] VGAM1879 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM1879 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26264] VGAM1879 gene, herein designated VGAM GENE, encodes a VGAM1879 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1879 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1879 precursor RNA is designated SEQ ID:1865, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1865 is located at position 5455 relative to the genome of Bovine respiratory syncytial virus.

[26265] VGAM1879 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26266] An enzyme complex designated DICER COMPLEX, dices the VGAM1879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1879 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1879 RNA is designated SEQ ID:4590, and is provided hereinbelow with reference to the sequence listing part.

[26267] VGAM1879 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26268] VGAM1879 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1879 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1879 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26269] The complementary binding of VGAM1879 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1879 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1879 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26270] It is appreciated that VGAM1879 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1879 host target genes. The mRNA of each one of this plurality of VGAM1879 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1879 RNA, herein designated VGAM RNA, and which when bound by VGAM1879 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1879 host target proteins.

[26271] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1879 gene, herein designated VGAM GENE, on one or more VGAM1879 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26272] It is yet further appreciated that a function of VGAM1879 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1879 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1879 correlate with, and may be deduced from, the identity of the host target genes which VGAM1879 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26273] Nucleotide sequences of the VGAM1879 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1879 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1879 are further

described hereinbelow with reference to Table 1.

[26274] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1879 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26275] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1880 (VGAM1880) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26276] VGAM1880 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1880 was detected is described hereinabove with reference to Figs. 2-8.

[26277] VGAM1880 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM1880 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26278] VGAM1880 gene, herein designated VGAM GENE, encodes a VGAM1880 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1880 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1880 precursor RNA is designated SEQ ID:1866, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1866 is located at position 14933 relative to the genome of Bovine respiratory syncytial virus.

[26279] VGAM1880 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26280] An enzyme complex designated DICER COMPLEX, dices

the VGAM1880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1880 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1880 RNA is designated SEQ ID:4591, and is provided hereinbelow with reference to the sequence listing part.

[26281] VGAM1880 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26282] VGAM1880 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1880 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1880 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1880 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26283] The complementary binding of VGAM1880 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1880 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26284] It is appreciated that VGAM1880 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1880 host target genes. The mRNA of each one of this plurality of VGAM1880 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1880 RNA, herein designated VGAM RNA, and which when bound by VGAM1880 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1880 host target proteins.

[26285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1880 gene, herein designated VGAM GENE, on one or more VGAM1880 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26286] It is yet further appreciated that a function of VGAM1880 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1880 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1880 correlate with, and may be deduced from, the identity of the host target genes which VGAM1880 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26287] Nucleotide sequences of the VGAM1880 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1880 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1880 are further described hereinbelow with reference to Table 1.

[26288] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1880 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26289] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1881 (VGAM1881) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26290] VGAM1881 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1881 was detected is described hereinabove with reference to Figs. 2-8.

[26291] VGAM1881 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM1881 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26292] VGAM1881 gene, herein designated VGAM GENE, encodes a VGAM1881 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1881 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1881 precursor RNA is designated SEQ ID:1867, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1867 is located at position 7527 relative to the genome of Bovine respiratory syncytial virus.

[26293] VGAM1881 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[26294] An enzyme complex designated DICER COMPLEX, dices the VGAM1881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1881 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1881 RNA is designated SEQ ID:4592, and is provided hereinbelow with reference to the sequence listing part.

[26295] VGAM1881 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26296] VGAM1881 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1881 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1881 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26297] The complementary binding of VGAM1881 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1881 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26298] It is appreciated that VGAM1881 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1881 host target genes. The mRNA of each one of this plurality of VGAM1881 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1881 RNA, herein designated VGAM RNA, and which when bound by VGAM1881 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1881 host target proteins.

[26299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1881 gene, herein designated VGAM GENE, on one or more VGAM1881 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26300] It is yet further appreciated that a function of VGAM1881 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1881 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1881 correlate with, and may be deduced from, the identity of the host target genes which VGAM1881 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26301] Nucleotide sequences of the VGAM1881 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1881 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1881 are further described hereinbelow with reference to Table 1.

[26302] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1881 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26303] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1882 (VGAM1882) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26304] VGAM1882 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1882 was detected is described hereinabove with reference to Figs. 2-8.

[26305] VGAM1882 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Bovine respiratory syncytial virus. VGAM1882 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26306] VGAM1882 gene, herein designated VGAM GENE, encodes a VGAM1882 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1882 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1882 precursor RNA is designated SEQ ID:1868, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1868 is located at position 417 relative to the genome of Bovine respiratory syncytial virus.

[26307] VGAM1882 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26308] An enzyme complex designated DICER COMPLEX, dices the VGAM1882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1882 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1882 RNA is designated SEQ ID:4593, and is provided hereinbelow with reference to the sequence listing part.

[26309] VGAM1882 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[26310] VGAM1882 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1882 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1882 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26311] The complementary binding of VGAM1882 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1882 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26312] It is appreciated that VGAM1882 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1882 host target genes. The mRNA of each one of this plurality of VGAM1882 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1882 RNA, herein designated VGAM RNA, and which when bound by VGAM1882 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1882 host target proteins.

[26313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1882 gene, herein designated VGAM GENE, on one

or more VGAM1882 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26314] It is yet further appreciated that a function of VGAM1882 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1882 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1882 correlate with, and may be deduced from, the identity of the host target genes which VGAM1882 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26315] Nucleotide sequences of the VGAM1882 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1882 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1882 are further described hereinbelow with reference to Table 1.

[26316] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1882 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26317] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1883 (VGAM1883) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26318] VGAM1883 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1883 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[26319] VGAM1883 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM1883 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26320] VGAM1883 gene, herein designated VGAM GENE, encodes a VGAM1883 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1883 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1883 precursor RNA is designated SEQ ID:1869, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1869 is located at position 10923 relative to the genome of Bovine respiratory syncytial virus.

[26321] VGAM1883 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26322] An enzyme complex designated DICER COMPLEX, dices the VGAM1883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1883 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1883 RNA is designated SEQ ID:4594, and is provided hereinbelow with reference to the sequence listing part.

[26323] VGAM1883 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26324] VGAM1883 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1883 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26325] The complementary binding of VGAM1883 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1883 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26326] It is appreciated that VGAM1883 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1883 host target genes. The mRNA of each one of this plurality of VGAM1883 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1883 RNA, herein designated VGAM RNA, and which when bound by VGAM1883 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1883 host target proteins.

[26327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1883 gene, herein designated VGAM GENE, on one or more VGAM1883 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26328] It is yet further appreciated that a function of VGAM1883 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1883 correlate with, and may be deduced from, the identity of the host target genes which VGAM1883 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26329] Nucleotide sequences of the VGAM1883 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1883 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1883 are further described hereinbelow with reference to Table 1.

[26330] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1883 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26331] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1884 (VGAM1884) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26332] VGAM1884 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1884 was detected is described hereinabove with reference to Figs. 2-8.

[26333] VGAM1884 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM1884 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26334] VGAM1884 gene, herein designated VGAM GENE, encodes a VGAM1884 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1884 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1884 precursor RNA is designated SEQ ID:1870, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1870 is located at position 8134 relative to the genome of Bovine respiratory syncytial virus.

[26335] VGAM1884 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1884 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26336] An enzyme complex designated DICER COMPLEX, dices the VGAM1884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1884 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1884 RNA is designated SEQ ID:4595, and is provided hereinbelow with reference to the sequence listing part.

[26337] VGAM1884 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1884 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26338] VGAM1884 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1884 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1884 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26339] The complementary binding of VGAM1884 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1884 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26340] It is appreciated that VGAM1884 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1884 host target genes. The mRNA of each one of this plurality of VGAM1884 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1884 RNA, herein designated VGAM RNA, and which when bound by VGAM1884 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1884 host target proteins.

[26341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1884 gene, herein designated VGAM GENE, on one or more VGAM1884 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26342] It is yet further appreciated that a function of VGAM1884 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1884 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of

VGAM1884 correlate with, and may be deduced from, the identity of the host target genes which VGAM1884 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26343] Nucleotide sequences of the VGAM1884 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1884 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1884 are further described hereinbelow with reference to Table 1.

[26344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1884 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26345] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1885 (VGAM1885) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[26346] VGAM1885 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1885 was detected is described hereinabove with reference to Figs. 2-8.

[26347] VGAM1885 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1885 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26348] VGAM1885 gene, herein designated VGAM GENE, encodes a VGAM1885 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1885 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1885 precursor RNA is designated SEQ ID:1871, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1871 is located at position 363 relative to the genome of Newcastle disease virus.

[26349] VGAM1885 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1885 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26350] An enzyme complex designated DICER COMPLEX, dices the VGAM1885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1885 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1885 RNA is designated SEQ ID:4596, and is provided hereinbelow with reference to the sequence listing part.

[26351] VGAM1885 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1885 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26352] VGAM1885 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1885 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26353] The complementary binding of VGAM1885 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1885 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26354] It is appreciated that VGAM1885 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1885 host target genes. The mRNA of each one of this plurality of VGAM1885 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1885 RNA, herein designated VGAM RNA, and which when bound by VGAM1885 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1885 host target proteins.

[26355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1885 gene, herein designated VGAM GENE, on one or more VGAM1885 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26356] It is yet further appreciated that a function of VGAM1885 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus.

Specific functions, and accordingly utilities, of VGAM1885 correlate with, and may be deduced from, the identity of the host target genes which VGAM1885 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26357] Nucleotide sequences of the VGAM1885 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1885 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1885 are further described hereinbelow with reference to Table 1.

[26358] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1885 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26359] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1886 (VGAM1886) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[26360] VGAM1886 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1886 was detected is described hereinabove with reference to Figs. 2-8.

[26361] VGAM1886 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1886 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26362] VGAM1886 gene, herein designated VGAM GENE, encodes a VGAM1886 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1886 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1886 precursor RNA is designated SEQ ID:1872, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1872 is located at position 7875 relative to the genome of Newcastle disease virus.

[26363] VGAM1886 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26364] An enzyme complex designated DICER COMPLEX, dices the VGAM1886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1886 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1886 RNA is designated SEQ ID:4597, and is provided hereinbelow with reference to the sequence listing part.

[26365] VGAM1886 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26366] VGAM1886 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1886 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1886 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1886 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26367] The complementary binding of VGAM1886 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1886 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26368] It is appreciated that VGAM1886 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1886 host target genes. The mRNA of each one of this plurality of VGAM1886 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1886 RNA, herein designated VGAM RNA, and which when bound by VGAM1886 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1886 host target proteins.

[26369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1886 gene, herein designated VGAM GENE, on one or more VGAM1886 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26370] It is yet further appreciated that a function of VGAM1886 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1886 include diagnosis, prevention and

treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM1886 correlate with, and may be deduced from, the identity of the host target genes which VGAM1886 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26371] Nucleotide sequences of the VGAM1886 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1886 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1886 are further described hereinbelow with reference to Table 1.

[26372] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1886 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26373] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1887 (VGAM1887) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26374] VGAM1887 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1887 was detected is described hereinabove with reference to Figs. 2-8.

[26375] VGAM1887 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1887 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26376] VGAM1887 gene, herein designated VGAM GENE, encodes a VGAM1887 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1887 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1887 precursor RNA is designated SEQ ID:1873, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1873 is located at position 4276 relative to the genome of Newcastle disease virus.

[26377] VGAM1887 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26378] An enzyme complex designated DICER COMPLEX, dices the VGAM1887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1887 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM1887 RNA is designated SEQ ID:4598, and is provided hereinbelow with reference to the sequence listing part.

[26379] VGAM1887 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26380] VGAM1887 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1887 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1887 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26381] The complementary binding of VGAM1887 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1887 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26382] It is appreciated that VGAM1887 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1887 host target genes. The mRNA of each one of this plurality of VGAM1887 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1887 RNA, herein designated VGAM

RNA, and which when bound by VGAM1887 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1887 host target proteins.

[26383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1887 gene, herein designated VGAM GENE, on one or more VGAM1887 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26384] It is yet further appreciated that a function of VGAM1887 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1887 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM1887 correlate with, and may be deduced from, the identity of the host target genes which VGAM1887 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26385] Nucleotide sequences of the VGAM1887 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1887 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1887 are further described hereinbelow with reference to Table 1.

[26386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1887 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26387] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1888 (VGAM1888) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26388] VGAM1888 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1888 was detected is described hereinabove with reference to Figs. 2-8.

[26389] VGAM1888 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1888 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26390] VGAM1888 gene, herein designated VGAM GENE, encodes a VGAM1888 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1888 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1888 precursor RNA is designated SEQ ID:1874, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1874 is located at position

12826 relative to the genome of Newcastle disease virus.

[26391] VGAM1888 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26392] An enzyme complex designated DICER COMPLEX, dices the VGAM1888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1888 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1888 RNA is designated SEQ ID:4599, and is provided hereinbelow with reference to the sequence listing part.

[26393] VGAM1888 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26394] VGAM1888 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1888 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1888 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26395] The complementary binding of VGAM1888 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1888 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26396] It is appreciated that VGAM1888 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1888 host target genes. The mRNA of each one of this plurality of VGAM1888 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1888 RNA, herein designated VGAM RNA, and which when bound by VGAM1888 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1888 host target proteins.

[26397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1888 gene, herein designated VGAM GENE, on one or more VGAM1888 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26398] It is yet further appreciated that a function of VGAM1888 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1888 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM1888 correlate with, and may be deduced from, the identity of the host target genes which VGAM1888 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26399] Nucleotide sequences of the VGAM1888 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1888 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1888 are further described hereinbelow with reference to Table 1.

[26400] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1888 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26401] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1889 (VGAM1889) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26402] VGAM1889 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1889 was detected is described hereinabove with reference to Figs. 2-8.

[26403] VGAM1889 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1889 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26404] VGAM1889 gene, herein designated VGAM GENE, encodes a VGAM1889 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1889 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1889 precursor RNA is designated SEQ ID:1875, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1875 is located at position 48 relative to the genome of Newcastle disease virus.

[26405] VGAM1889 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26406] An enzyme complex designated DICER COMPLEX, dices the VGAM1889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1889 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1889 RNA is designated SEQ ID:4600, and is provided hereinbelow with reference to the sequence

listing part.

[26407] VGAM1889 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26408] VGAM1889 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1889 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26409] The complementary binding of VGAM1889 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1889 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26410] It is appreciated that VGAM1889 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1889 host target genes. The mRNA of each one of this plurality of VGAM1889 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1889 RNA, herein designated VGAM RNA, and which when bound by VGAM1889 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1889 host target proteins.

[26411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1889 gene, herein designated VGAM GENE, on one or more VGAM1889 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26412] It is yet further appreciated that a function of VGAM1889

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM1889 correlate with, and may be deduced from, the identity of the host target genes which VGAM1889 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26413] Nucleotide sequences of the VGAM1889 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1889 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1889 are further described hereinbelow with reference to Table 1.

[26414] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1889 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26415] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1890 (VGAM1890) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26416] VGAM1890 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1890 was detected is described hereinabove with reference to Figs. 2-8.

[26417] VGAM1890 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1890 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26418] VGAM1890 gene, herein designated VGAM GENE, encodes a VGAM1890 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1890 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1890 precursor RNA is designated SEQ ID:1876, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1876 is located at position 14381 relative to the genome of Newcastle disease virus.

[26419] VGAM1890 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26420] An enzyme complex designated DICER COMPLEX, dices the VGAM1890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1890 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1890 RNA is designated SEQ ID:4601, and

is provided hereinbelow with reference to the sequence listing part.

[26421] VGAM1890 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26422] VGAM1890 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1890 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1890 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26423] The complementary binding of VGAM1890 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1890 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26424] It is appreciated that VGAM1890 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1890 host target genes. The mRNA of each one of this plurality of VGAM1890 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1890 RNA, herein designated VGAM RNA, and which when bound by VGAM1890 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1890 host target proteins.

[26425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1890 gene, herein designated VGAM GENE, on one or more VGAM1890 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26426] It is yet further appreciated that a function of VGAM1890 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1890 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM1890 correlate with, and may be deduced from, the identity of the host target genes which VGAM1890 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26427] Nucleotide sequences of the VGAM1890 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1890 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1890 are further described hereinbelow with reference to Table 1.

[26428] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1890 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26429] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1891 (VGAM1891) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26430] VGAM1891 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1891 was detected is described hereinabove with reference to Figs. 2-8.

[26431] VGAM1891 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1891 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26432] VGAM1891 gene, herein designated VGAM GENE, encodes a VGAM1891 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1891 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1891 precur-

sor RNA is designated SEQ ID:1877, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1877 is located at position 8373 relative to the genome of Newcastle disease virus.

[26433] VGAM1891 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26434] An enzyme complex designated DICER COMPLEX, dices the VGAM1891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1891 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide se-

quence of VGAM1891 RNA is designated SEQ ID:4602, and is provided hereinbelow with reference to the sequence listing part.

[26435] VGAM1891 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26436] VGAM1891 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1891 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26437] The complementary binding of VGAM1891 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1891 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26438] It is appreciated that VGAM1891 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1891 host target genes. The mRNA of

each one of this plurality of VGAM1891 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1891 RNA, herein designated VGAM RNA, and which when bound by VGAM1891 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1891 host target proteins.

[26439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1891 gene, herein designated VGAM GENE, on one or more VGAM1891 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[26440] It is yet further appreciated that a function of VGAM1891 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM1891 correlate with, and may be deduced from, the identity of the host target genes which VGAM1891 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26441] Nucleotide sequences of the VGAM1891 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1891 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1891 are further described hereinbelow with reference to Table 1.

[26442] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1891 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[26443] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1892 (VGAM1892) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26444] VGAM1892 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1892 was detected is described hereinabove with reference to Figs. 2-8.

[26445] VGAM1892 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1892 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26446] VGAM1892 gene, herein designated VGAM GENE, encodes a VGAM1892 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1892 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1892 precursor RNA is designated SEQ ID:1878, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1878 is located at position 13642 relative to the genome of Newcastle disease virus.

[26447] VGAM1892 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26448] An enzyme complex designated DICER COMPLEX, dices the VGAM1892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1892 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1892 RNA is designated SEQ ID:4603, and is provided hereinbelow with reference to the sequence listing part.

[26449] VGAM1892 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26450] VGAM1892 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1892 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26451] The complementary binding of VGAM1892 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1892 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26452] It is appreciated that VGAM1892 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1892 host target genes. The mRNA of each one of this plurality of VGAM1892 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1892 RNA, herein designated VGAM RNA, and which when bound by VGAM1892 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1892 host target proteins.

[26453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1892 gene, herein designated VGAM GENE, on one or more VGAM1892 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26454] It is yet further appreciated that a function of VGAM1892 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM1892 correlate with, and may be deduced from, the identity of the host target genes which VGAM1892 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26455] Nucleotide sequences of the VGAM1892 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1892 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1892 are further described hereinbelow with reference to Table 1.

[26456] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1892 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26457] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1893 (VGAM1893) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26458] VGAM1893 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1893 was detected is described hereinabove with reference to Figs. 2-8.

[26459] VGAM1893 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM1893 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26460] VGAM1893 gene, herein designated VGAM GENE, encodes a VGAM1893 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1893 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1893 precursor RNA is designated SEQ ID:1879, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1879 is located at position 2483 relative to the genome of Newcastle disease virus.

[26461] VGAM1893 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26462] An enzyme complex designated DICER COMPLEX, dices the VGAM1893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1893 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1893 RNA is designated SEQ ID:4604, and is provided hereinbelow with reference to the sequence listing part.

[26463] VGAM1893 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26464] VGAM1893 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1893 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26465] The complementary binding of VGAM1893 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1893 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26466] It is appreciated that VGAM1893 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1893 host target genes. The mRNA of each one of this plurality of VGAM1893 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1893 RNA, herein designated VGAM RNA, and which when bound by VGAM1893 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1893 host target proteins.

[26467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1893 gene, herein designated VGAM GENE, on one or more VGAM1893 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26468] It is yet further appreciated that a function of VGAM1893 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM1893 correlate with, and may be deduced from, the identity of the host target genes which VGAM1893 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26469] Nucleotide sequences of the VGAM1893 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1893 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1893 are further described hereinbelow with reference to Table 1.

[26470] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1893 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26471] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1894 (VGAM1894) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26472] VGAM1894 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1894 was detected is described hereinabove with reference to Figs. 2-8.

[26473] VGAM1894 gene, herein designated VGAM GENE, is a viral gene contained in the genome of respiratory syncytial virus. VGAM1894 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26474] VGAM1894 gene, herein designated VGAM GENE, encodes a VGAM1894 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1894 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1894 precursor RNA is designated SEQ ID:1880, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1880 is located at position 6434 relative to the genome of respiratory syncytial virus.

[26475] VGAM1894 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26476] An enzyme complex designated DICER COMPLEX, dices the VGAM1894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1894 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1894 RNA is designated SEQ ID:4605, and is provided hereinbelow with reference to the sequence listing part.

[26477] VGAM1894 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26478] VGAM1894 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1894 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1894 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26479] The complementary binding of VGAM1894 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1894 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26480] It is appreciated that VGAM1894 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1894 host target genes. The mRNA of each one of this plurality of VGAM1894 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1894 RNA, herein designated VGAM RNA, and which when bound by VGAM1894 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1894 host target proteins.

[26481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1894 gene, herein designated VGAM GENE, on one or more VGAM1894 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26482] It is yet further appreciated that a function of VGAM1894 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1894 include diagnosis, prevention and treatment of viral infection by respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1894 correlate with, and may be deduced from, the identity of the host target genes which VGAM1894 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26483] Nucleotide sequences of the VGAM1894 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1894 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1894 are further described hereinbelow with reference to Table 1.

[26484] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1894 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26485] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1895 (VGAM1895) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26486] VGAM1895 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1895 was detected is described hereinabove with reference to Figs. 2-8.

[26487] VGAM1895 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic latent virus. VGAM1895 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26488] VGAM1895 gene, herein designated VGAM GENE, encodes a VGAM1895 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1895 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1895 precursor RNA is designated SEQ ID:1881, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1881 is located at position 2156 relative to the genome of Garlic latent virus.

[26489] VGAM1895 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26490] An enzyme complex designated DICER COMPLEX, dices the VGAM1895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1895 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1895 RNA is designated SEQ ID:4606, and is provided hereinbelow with reference to the sequence listing part.

[26491] VGAM1895 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26492] VGAM1895 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1895 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26493] The complementary binding of VGAM1895 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1895 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[26494] It is appreciated that VGAM1895 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1895 host target genes. The mRNA of each one of this plurality of VGAM1895 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1895 RNA, herein designated VGAM RNA, and which when bound by VGAM1895 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1895 host target proteins.

[26495] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1895 gene, herein designated VGAM GENE, on one or more VGAM1895 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26496] It is yet further appreciated that a function of VGAM1895 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of viral infection by Garlic latent virus. Specific functions, and accordingly utilities, of VGAM1895 correlate with, and may be deduced from, the identity of the host target genes which VGAM1895 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26497] Nucleotide sequences of the VGAM1895 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1895 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1895 are further described hereinbelow with reference to Table 1.

[26498] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1895 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26499] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1896 (VGAM1896) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26500] VGAM1896 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1896 was detected is described hereinabove with reference to Figs. 2-8.

[26501] VGAM1896 gene, herein designated VGAM GENE, is a viral gene contained in the genome of respiratory syncytial virus. VGAM1896 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26502] VGAM1896 gene, herein designated VGAM GENE, encodes a VGAM1896 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1896 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1896 precursor RNA is designated SEQ ID:1882, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1882 is located at position 4399 relative to the genome of respiratory syncytial virus.

[26503] VGAM1896 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26504] An enzyme complex designated DICER COMPLEX, dices the VGAM1896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1896 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1896 RNA is designated SEQ ID:4607, and is provided hereinbelow with reference to the sequence listing part.

[26505] VGAM1896 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26506] VGAM1896 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1896 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1896 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26507] The complementary binding of VGAM1896 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1896 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26508] It is appreciated that VGAM1896 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1896 host target genes. The mRNA of each one of this plurality of VGAM1896 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1896 RNA, herein designated VGAM RNA, and which when bound by VGAM1896 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1896 host target proteins.

[26509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1896 gene, herein designated VGAM GENE, on one or more VGAM1896 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26510] It is yet further appreciated that a function of VGAM1896 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of viral infection by respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1896 correlate with, and may be deduced from, the identity of the host target genes which VGAM1896 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26511] Nucleotide sequences of the VGAM1896 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1896 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1896 are further described hereinbelow with reference to Table 1.

[26512] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1896 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26513] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1897 (VGAM1897) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26514] VGAM1897 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1897 was detected is described hereinabove with reference to Figs. 2-8.

[26515] VGAM1897 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic latent virus. VGAM1897 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26516] VGAM1897 gene, herein designated VGAM GENE, encodes a VGAM1897 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1897 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1897 precur-

sor RNA is designated SEQ ID:1883, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1883 is located at position 5382 relative to the genome of Garlic latent virus.

[26517] VGAM1897 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26518] An enzyme complex designated DICER COMPLEX, dices the VGAM1897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1897 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1897 RNA is designated SEQ ID:4608, and is provided hereinbelow with reference to the sequence listing part.

[26519] VGAM1897 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26520] VGAM1897 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1897 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26521] The complementary binding of VGAM1897 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1897 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26522] It is appreciated that VGAM1897 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1897 host target genes. The mRNA of

each one of this plurality of VGAM1897 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1897 RNA, herein designated VGAM RNA, and which when bound by VGAM1897 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1897 host target proteins.

[26523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1897 gene, herein designated VGAM GENE, on one or more VGAM1897 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[26524] It is yet further appreciated that a function of VGAM1897 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of viral infection by Garlic latent virus. Specific functions, and accordingly utilities, of VGAM1897 correlate with, and may be deduced from, the identity of the host target genes which VGAM1897 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26525] Nucleotide sequences of the VGAM1897 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1897 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1897 are further described hereinbelow with reference to Table 1.

[26526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1897 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[26527] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1898 (VGAM1898) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26528] VGAM1898 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1898 was detected is described hereinabove with reference to Figs. 2-8.

[26529] VGAM1898 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic latent virus. VGAM1898 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26530] VGAM1898 gene, herein designated VGAM GENE, encodes a VGAM1898 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1898 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1898 precursor RNA is designated SEQ ID:1884, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1884 is located at position 4971 relative to the genome of Garlic latent virus.

[26531] VGAM1898 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26532] An enzyme complex designated DICER COMPLEX, dices the VGAM1898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1898 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1898 RNA is designated SEQ ID:4609, and is provided hereinbelow with reference to the sequence listing part.

[26533] VGAM1898 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26534] VGAM1898 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1898 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1898 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26535] The complementary binding of VGAM1898 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1898 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26536] It is appreciated that VGAM1898 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1898 host target genes. The mRNA of each one of this plurality of VGAM1898 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1898 RNA, herein designated VGAM RNA, and which when bound by VGAM1898 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1898 host target proteins.

[26537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1898 gene, herein designated VGAM GENE, on one or more VGAM1898 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26538] It is yet further appreciated that a function of VGAM1898 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1898 include diagnosis, prevention and treatment of viral infection by Garlic latent virus. Specific functions, and accordingly utilities, of VGAM1898 correlate with, and may be deduced from, the identity of the host target genes which VGAM1898 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26539] Nucleotide sequences of the VGAM1898 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1898 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1898 are further described hereinbelow with reference to Table 1.

[26540] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1898 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26541] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1899 (VGAM1899) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26542] VGAM1899 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1899 was detected is described hereinabove with reference to Figs. 2-8.

[26543] VGAM1899 gene, herein designated VGAM GENE, is a viral gene contained in the genome of respiratory syncytial virus. VGAM1899 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26544] VGAM1899 gene, herein designated VGAM GENE, encodes a VGAM1899 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1899 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1899 precursor RNA is designated SEQ ID:1885, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1885 is located at position 7191 relative to the genome of respiratory syncytial virus.

[26545] VGAM1899 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26546] An enzyme complex designated DICER COMPLEX, dices the VGAM1899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1899 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1899 RNA is designated SEQ ID:4610, and is provided hereinbelow with reference to the sequence listing part.

[26547] VGAM1899 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26548] VGAM1899 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1899 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26549] The complementary binding of VGAM1899 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1899 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26550] It is appreciated that VGAM1899 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1899 host target genes. The mRNA of each one of this plurality of VGAM1899 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1899 RNA, herein designated VGAM RNA, and which when bound by VGAM1899 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1899 host target proteins.

[26551] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1899 gene, herein designated VGAM GENE, on one or more VGAM1899 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26552] It is yet further appreciated that a function of VGAM1899 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of viral infection by respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1899 correlate with, and may be deduced from, the identity of the host target genes which VGAM1899 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26553] Nucleotide sequences of the VGAM1899 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1899 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1899 are further described hereinbelow with reference to Table 1.

[26554] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1899 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26555] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1900 (VGAM1900) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26556] VGAM1900 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1900 was detected is described hereinabove with reference to Figs. 2-8.

[26557] VGAM1900 gene, herein designated VGAM GENE, is a viral gene contained in the genome of respiratory syncytial virus. VGAM1900 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26558] VGAM1900 gene, herein designated VGAM GENE, encodes a VGAM1900 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1900 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1900 precursor RNA is designated SEQ ID:1886, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1886 is located at position 438 relative to the genome of respiratory syncytial virus.

[26559] VGAM1900 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26560] An enzyme complex designated DICER COMPLEX, dices the VGAM1900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1900 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1900 RNA is designated SEQ ID:4611, and is provided hereinbelow with reference to the sequence listing part.

[26561] VGAM1900 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26562] VGAM1900 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1900 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26563] The complementary binding of VGAM1900 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1900 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26564] It is appreciated that VGAM1900 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1900 host target genes. The mRNA of each one of this plurality of VGAM1900 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1900 RNA, herein designated VGAM RNA, and which when bound by VGAM1900 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1900 host target proteins.

[26565] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1900 gene, herein designated VGAM GENE, on one or more VGAM1900 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26566] It is yet further appreciated that a function of VGAM1900 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of viral infection by respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1900 correlate with, and may be deduced from, the identity of the host target genes which VGAM1900 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26567] Nucleotide sequences of the VGAM1900 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1900 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1900 are further described hereinbelow with reference to Table 1.

[26568] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1900 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26569] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1901 (VGAM1901) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26570] VGAM1901 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1901 was detected is described hereinabove with reference to Figs. 2-8.

[26571] VGAM1901 gene, herein designated VGAM GENE, is a viral gene contained in the genome of respiratory syncytial virus. VGAM1901 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26572] VGAM1901 gene, herein designated VGAM GENE, encodes a VGAM1901 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1901 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1901 precursor RNA is designated SEQ ID:1887, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1887 is located at position 2370 relative to the genome of respiratory syncytial virus.

[26573] VGAM1901 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26574] An enzyme complex designated DICER COMPLEX, dices the VGAM1901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1901 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1901 RNA is designated SEQ ID:4612, and is provided hereinbelow with reference to the sequence listing part.

[26575] VGAM1901 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26576] VGAM1901 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1901 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26577] The complementary binding of VGAM1901 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1901 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[26578] It is appreciated that VGAM1901 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1901 host target genes. The mRNA of each one of this plurality of VGAM1901 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1901 RNA, herein designated VGAM RNA, and which when bound by VGAM1901 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1901 host target proteins.

[26579] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1901 gene, herein designated VGAM GENE, on one or more VGAM1901 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26580] It is yet further appreciated that a function of VGAM1901 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of viral infection by respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1901 correlate with, and may be deduced from, the identity of the host target genes which VGAM1901 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26581] Nucleotide sequences of the VGAM1901 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1901 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1901 are further described hereinbelow with reference to Table 1.

[26582] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1901 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26583] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1902 (VGAM1902) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26584] VGAM1902 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1902 was detected is described hereinabove with reference to Figs. 2-8.

[26585] VGAM1902 gene, herein designated VGAM GENE, is a viral gene contained in the genome of respiratory syncytial virus. VGAM1902 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26586] VGAM1902 gene, herein designated VGAM GENE, encodes a VGAM1902 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1902 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1902 precursor RNA is designated SEQ ID:1888, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1888 is located at position 8673 relative to the genome of respiratory syncytial virus.

[26587] VGAM1902 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26588] An enzyme complex designated DICER COMPLEX, dices the VGAM1902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1902 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1902 RNA is designated SEQ ID:4613, and is provided hereinbelow with reference to the sequence listing part.

[26589] VGAM1902 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26590] VGAM1902 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1902 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1902 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26591] The complementary binding of VGAM1902 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1902 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26592] It is appreciated that VGAM1902 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1902 host target genes. The mRNA of each one of this plurality of VGAM1902 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1902 RNA, herein designated VGAM RNA, and which when bound by VGAM1902 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1902 host target proteins.

[26593] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1902 gene, herein designated VGAM GENE, on one or more VGAM1902 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26594] It is yet further appreciated that a function of VGAM1902 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1902 include diagnosis, prevention and treatment of viral infection by respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1902 correlate with, and may be deduced from, the identity of the host target genes which VGAM1902 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26595] Nucleotide sequences of the VGAM1902 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1902 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1902 are further described hereinbelow with reference to Table 1.

[26596] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1902 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26597] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1903 (VGAM1903) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26598] VGAM1903 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1903 was detected is described hereinabove with reference to Figs. 2-8.

[26599] VGAM1903 gene, herein designated VGAM GENE, is a viral gene contained in the genome of respiratory syncytial virus. VGAM1903 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26600] VGAM1903 gene, herein designated VGAM GENE, encodes

a VGAM1903 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1903 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1903 precursor RNA is designated SEQ ID:1889, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1889 is located at position 14231 relative to the genome of respiratory syncytial virus.

[26601] VGAM1903 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26602] An enzyme complex designated DICER COMPLEX, dices the VGAM1903 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1903 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1903 RNA is designated SEQ ID:4614, and is provided hereinbelow with reference to the sequence listing part.

[26603] VGAM1903 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26604] VGAM1903 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1903 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26605] The complementary binding of VGAM1903 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1903

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1903 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26606] It is appreciated that VGAM1903 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1903 host target genes. The mRNA of each one of this plurality of VGAM1903 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1903 RNA, herein designated VGAM RNA, and which when bound by VGAM1903 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1903 host target proteins.

[26607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1903 gene, herein designated VGAM GENE, on one or more VGAM1903 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26608] It is yet further appreciated that a function of VGAM1903 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of viral infection by respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1903 correlate with, and may be deduced from, the identity of the host target genes which VGAM1903 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26609] Nucleotide sequences of the VGAM1903 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1903 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1903 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1903 are further described hereinbelow with reference to Table 1.

[26610] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1903 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26611] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1904 (VGAM1904) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26612] VGAM1904 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1904 was detected is described hereinabove with reference to Figs. 2-8.

[26613] VGAM1904 gene, herein designated VGAM GENE, is a viral gene contained in the genome of respiratory syncytial virus. VGAM1904 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[26614] VGAM1904 gene, herein designated VGAM GENE, encodes a VGAM1904 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1904 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1904 precursor RNA is designated SEQ ID:1890, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1890 is located at position 8364 relative to the genome of respiratory syncytial virus.

[26615] VGAM1904 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26616] An enzyme complex designated DICER COMPLEX, dices

the VGAM1904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1904 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1904 RNA is designated SEQ ID:4615, and is provided hereinbelow with reference to the sequence listing part.

[26617] VGAM1904 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26618] VGAM1904 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1904 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1904 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1904 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26619] The complementary binding of VGAM1904 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1904 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26620] It is appreciated that VGAM1904 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1904 host target genes. The mRNA of each one of this plurality of VGAM1904 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1904 RNA, herein designated VGAM RNA, and which when bound by VGAM1904 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1904 host target proteins.

[26621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1904 gene, herein designated VGAM GENE, on one or more VGAM1904 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26622] It is yet further appreciated that a function of VGAM1904 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1904 include diagnosis, prevention and treatment of viral infection by respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM1904 correlate with, and may be deduced from, the identity of the host target genes which VGAM1904 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26623] Nucleotide sequences of the VGAM1904 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1904 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1904 are further described hereinbelow with reference to Table 1.

[26624] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1904 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26625] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1905 (VGAM1905) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26626] VGAM1905 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1905 was detected is described hereinabove with reference to Figs. 2-8.

[26627] VGAM1905 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai virus. VGAM1905 host target gene, herein designated VGAM HOST TARGET

GENE, is a human gene contained in the human genome.

[26628] VGAM1905 gene, herein designated VGAM GENE, encodes a VGAM1905 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1905 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1905 precursor RNA is designated SEQ ID:1891, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1891 is located at position 5191 relative to the genome of Sendai virus.

[26629] VGAM1905 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26630] An enzyme complex designated DICER COMPLEX, dices

the VGAM1905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1905 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM1905 RNA is designated SEQ ID:4616, and is provided hereinbelow with reference to the sequence listing part.

[26631] VGAM1905 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1905 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1905 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26632] VGAM1905 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1905 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1905 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1905 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26633] The complementary binding of VGAM1905 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1905 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1905 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1905 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26634] It is appreciated that VGAM1905 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1905 host target genes. The mRNA of each one of this plurality of VGAM1905 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1905 RNA, herein designated VGAM RNA, and which when bound by VGAM1905 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1905 host target proteins.

[26635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1905 gene, herein designated VGAM GENE, on one or more VGAM1905 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26636] It is yet further appreciated that a function of VGAM1905 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of viral infection by Sendai virus. Specific functions, and accordingly utilities, of VGAM1905 correlate with, and may be deduced from, the identity of the host target genes which VGAM1905 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26637] Nucleotide sequences of the VGAM1905 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1905 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1905 are further described hereinbelow with reference to Table 1.

[26638] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1905 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26639] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1906 (VGAM1906) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26640] VGAM1906 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1906 was detected is described hereinabove with reference to Figs. 2-8.

[26641] VGAM1906 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai virus. VGAM1906 host target gene, herein designated VGAM HOST TARGET

GENE, is a human gene contained in the human genome.

[26642] VGAM1906 gene, herein designated VGAM GENE, encodes a VGAM1906 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1906 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1906 precursor RNA is designated SEQ ID:1892, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1892 is located at position 15052 relative to the genome of Sendai virus.

[26643] VGAM1906 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26644] An enzyme complex designated DICER COMPLEX, dices

the VGAM1906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1906 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1906 RNA is designated SEQ ID:4617, and is provided hereinbelow with reference to the sequence listing part.

[26645] VGAM1906 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1906 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1906 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26646] VGAM1906 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1906 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1906 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1906 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1906 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26647] The complementary binding of VGAM1906 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1906 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1906 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1906 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26648] It is appreciated that VGAM1906 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1906 host target genes. The mRNA of each one of this plurality of VGAM1906 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1906 RNA, herein designated VGAM RNA, and which when bound by VGAM1906 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1906 host target proteins.

[26649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1906 gene, herein designated VGAM GENE, on one or more VGAM1906 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26650] It is yet further appreciated that a function of VGAM1906 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1906 include diagnosis, prevention and treatment of viral infection by Sendai virus. Specific functions, and accordingly utilities, of VGAM1906 correlate with, and may be deduced from, the identity of the host target genes which VGAM1906 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26651] Nucleotide sequences of the VGAM1906 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1906 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1906 are further described hereinbelow with reference to Table 1.

[26652] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1906 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26653] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1907 (VGAM1907) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26654] VGAM1907 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1907 was detected is described hereinabove with reference to Figs. 2-8.

[26655] VGAM1907 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 3. VGAM1907 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26656] VGAM1907 gene, herein designated VGAM GENE, encodes a VGAM1907 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1907 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1907 precursor RNA is designated SEQ ID:1893, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1893 is located at position 7040 relative to the genome of Human parainfluenza virus 3.

[26657] VGAM1907 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26658] An enzyme complex designated DICER COMPLEX, dices the VGAM1907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1907 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1907 RNA is designated SEQ ID:4618, and is provided hereinbelow with reference to the sequence listing part.

[26659] VGAM1907 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26660] VGAM1907 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1907 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1907 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26661] The complementary binding of VGAM1907 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1907 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1907 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26662] It is appreciated that VGAM1907 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1907 host target genes. The mRNA of each one of this plurality of VGAM1907 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1907 RNA, herein designated VGAM RNA, and which when bound by VGAM1907 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1907 host target proteins.

[26663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1907 gene, herein designated VGAM GENE, on one or more VGAM1907 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26664] It is yet further appreciated that a function of VGAM1907 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1907 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM1907 correlate with, and may be deduced from, the identity of the host target genes which VGAM1907 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26665] Nucleotide sequences of the VGAM1907 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1907 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1907 are further described hereinbelow with reference to Table 1.

[26666] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1907 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26667] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1908 (VGAM1908) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26668] VGAM1908 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1908 was detected is described hereinabove with reference to Figs. 2-8.

[26669] VGAM1908 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza

virus 3. VGAM1908 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26670] VGAM1908 gene, herein designated VGAM GENE, encodes a VGAM1908 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1908 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1908 precursor RNA is designated SEQ ID:1894, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1894 is located at position 8620 relative to the genome of Human parainfluenza virus 3.

[26671] VGAM1908 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[26672] An enzyme complex designated DICER COMPLEX, dices the VGAM1908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1908 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1908 RNA is designated SEQ ID:4619, and is provided hereinbelow with reference to the sequence listing part.

[26673] VGAM1908 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26674] VGAM1908 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1908 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1908 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26675] The complementary binding of VGAM1908 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1908 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26676] It is appreciated that VGAM1908 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1908 host target genes. The mRNA of each one of this plurality of VGAM1908 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1908 RNA, herein designated VGAM RNA, and which when bound by VGAM1908 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1908 host target proteins.

[26677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1908 gene, herein designated VGAM GENE, on one or more VGAM1908 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26678] It is yet further appreciated that a function of VGAM1908 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1908 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM1908 correlate with, and may be deduced from, the identity of the host target genes which VGAM1908 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26679] Nucleotide sequences of the VGAM1908 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1908 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1908 are further described hereinbelow with reference to Table 1.

[26680] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1908 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26681] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1909 (VGAM1909) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26682] VGAM1909 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1909 was detected is described hereinabove with reference to Figs. 2-8.

[26683] VGAM1909 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human parainfluenza virus 3. VGAM1909 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26684] VGAM1909 gene, herein designated VGAM GENE, encodes a VGAM1909 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1909 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1909 precursor RNA is designated SEQ ID:1895, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1895 is located at position 5850 relative to the genome of Human parainfluenza virus 3.

[26685] VGAM1909 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26686] An enzyme complex designated DICER COMPLEX, dices the VGAM1909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1909 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1909 RNA is designated SEQ ID:4620, and is provided hereinbelow with reference to the sequence listing part.

[26687] VGAM1909 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26688] VGAM1909 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1909 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26689] The complementary binding of VGAM1909 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1909 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26690] It is appreciated that VGAM1909 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1909 host target genes. The mRNA of each one of this plurality of VGAM1909 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1909 RNA, herein designated VGAM RNA, and which when bound by VGAM1909 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1909 host target proteins.

[26691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1909 gene, herein designated VGAM GENE, on one or more VGAM1909 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26692] It is yet further appreciated that a function of VGAM1909 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM1909 correlate with, and may be deduced from, the identity of the host target genes which VGAM1909 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26693] Nucleotide sequences of the VGAM1909 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1909 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1909 are further described hereinbelow with reference to Table 1.

[26694] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1909 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26695] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1910 (VGAM1910) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26696] VGAM1910 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1910 was detected is described hereinabove with reference to Figs. 2-8.

[26697] VGAM1910 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 3. VGAM1910 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26698] VGAM1910 gene, herein designated VGAM GENE, encodes a VGAM1910 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1910 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1910 precursor RNA is designated SEQ ID:1896, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1896 is located at position 8937 relative to the genome of Human parainfluenza virus 3.

[26699] VGAM1910 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26700] An enzyme complex designated DICER COMPLEX, dices the VGAM1910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1910 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1910 RNA is designated SEQ ID:4621, and is provided hereinbelow with reference to the sequence listing part.

[26701] VGAM1910 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[26702] VGAM1910 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1910 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1910 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26703] The complementary binding of VGAM1910 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1910 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26704] It is appreciated that VGAM1910 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1910 host target genes. The mRNA of each one of this plurality of VGAM1910 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1910 RNA, herein designated VGAM RNA, and which when bound by VGAM1910 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1910 host target proteins.

[26705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1910 gene, herein designated VGAM GENE, on one

or more VGAM1910 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26706] It is yet further appreciated that a function of VGAM1910 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM1910 correlate with, and may be deduced from, the identity of the host target genes which VGAM1910 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26707] Nucleotide sequences of the VGAM1910 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1910 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1910 are further described hereinbelow with reference to Table 1.

[26708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1910 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26709] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1911 (VGAM1911) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26710] VGAM1911 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1911 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[26711] VGAM1911 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 3. VGAM1911 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26712] VGAM1911 gene, herein designated VGAM GENE, encodes a VGAM1911 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1911 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1911 precursor RNA is designated SEQ ID:1897, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1897 is located at position 1061 relative to the genome of Human parainfluenza virus 3.

[26713] VGAM1911 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26714] An enzyme complex designated DICER COMPLEX, dices the VGAM1911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1911 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1911 RNA is designated SEQ ID:4622, and is provided hereinbelow with reference to the sequence listing part.

[26715] VGAM1911 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26716] VGAM1911 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1911 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[26717] The complementary binding of VGAM1911 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1911 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26718] It is appreciated that VGAM1911 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1911 host target genes. The mRNA of each one of this plurality of VGAM1911 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1911 RNA, herein designated VGAM RNA, and which when bound by VGAM1911 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1911 host target proteins.

[26719] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1911 gene, herein designated VGAM GENE, on one or more VGAM1911 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26720] It is yet further appreciated that a function of VGAM1911 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM1911 correlate with, and may be deduced from, the identity of the host target genes which VGAM1911 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[26721] Nucleotide sequences of the VGAM1911 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1911 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1911 are further described hereinbelow with reference to Table 1.

[26722] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1911 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26723] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1912 (VGAM1912) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26724] VGAM1912 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1912 was detected is described hereinabove with reference to Figs. 2-8.

[26725] VGAM1912 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 3. VGAM1912 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26726] VGAM1912 gene, herein designated VGAM GENE, encodes a VGAM1912 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1912 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1912 precursor RNA is designated SEQ ID:1898, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1898 is located at position 12367 relative to the genome of Human parainfluenza virus 3.

[26727] VGAM1912 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26728] An enzyme complex designated DICER COMPLEX, dices the VGAM1912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1912 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1912 RNA is designated SEQ ID:4623, and is provided hereinbelow with reference to the sequence listing part.

[26729] VGAM1912 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26730] VGAM1912 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1912 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26731] The complementary binding of VGAM1912 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1912 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26732] It is appreciated that VGAM1912 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1912 host target genes. The mRNA of each one of this plurality of VGAM1912 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1912 RNA, herein designated VGAM RNA, and which when bound by VGAM1912 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1912 host target proteins.

[26733] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1912 gene, herein designated VGAM GENE, on one or more VGAM1912 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26734] It is yet further appreciated that a function of VGAM1912 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM1912 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1912 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26735] Nucleotide sequences of the VGAM1912 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1912 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1912 are further described hereinbelow with reference to Table 1.

[26736] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1912 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26737] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1913 (VGAM1913) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26738] VGAM1913 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1913 was detected is described hereinabove with reference to Figs. 2-8.

[26739] VGAM1913 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 3. VGAM1913 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26740] VGAM1913 gene, herein designated VGAM GENE, encodes a VGAM1913 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1913 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1913 precursor RNA is designated SEQ ID:1899, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1899 is located at position 8166 relative to the genome of Human parainfluenza virus 3.

[26741] VGAM1913 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1913 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26742] An enzyme complex designated DICER COMPLEX, dices the VGAM1913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1913 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1913 RNA is designated SEQ ID:4624, and is provided hereinbelow with reference to the sequence listing part.

[26743] VGAM1913 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1913 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26744] VGAM1913 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1913 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1913 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26745] The complementary binding of VGAM1913 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1913 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26746] It is appreciated that VGAM1913 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1913 host target genes. The mRNA of each one of this plurality of VGAM1913 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1913 RNA, herein designated VGAM RNA, and which when bound by VGAM1913 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1913 host target proteins.

[26747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1913 gene, herein designated VGAM GENE, on one or more VGAM1913 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26748] It is yet further appreciated that a function of VGAM1913 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1913 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of

VGAM1913 correlate with, and may be deduced from, the identity of the host target genes which VGAM1913 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26749] Nucleotide sequences of the VGAM1913 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1913 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1913 are further described hereinbelow with reference to Table 1.

[26750] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1913 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26751] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1914 (VGAM1914) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[26752] VGAM1914 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1914 was detected is described hereinabove with reference to Figs. 2-8.

[26753] VGAM1914 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 3. VGAM1914 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26754] VGAM1914 gene, herein designated VGAM GENE, encodes a VGAM1914 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1914 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1914 precursor RNA is designated SEQ ID:1900, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1900 is located at position 14210 relative to the genome of Human parainfluenza virus 3.

[26755] VGAM1914 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26756] An enzyme complex designated DICER COMPLEX, dices the VGAM1914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1914 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1914 RNA is designated SEQ ID:4625, and is provided hereinbelow with reference to the sequence listing part.

[26757] VGAM1914 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26758] VGAM1914 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1914 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1914 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26759] The complementary binding of VGAM1914 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1914 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26760] It is appreciated that VGAM1914 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1914 host target genes. The mRNA of each one of this plurality of VGAM1914 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1914 RNA, herein designated VGAM RNA, and which when bound by VGAM1914 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1914 host target proteins.

[26761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1914 gene, herein designated VGAM GENE, on one or more VGAM1914 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26762] It is yet further appreciated that a function of VGAM1914 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1914 include diagnosis, prevention and

treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM1914 correlate with, and may be deduced from, the identity of the host target genes which VGAM1914 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26763] Nucleotide sequences of the VGAM1914 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1914 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1914 are further described hereinbelow with reference to Table 1.

[26764] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1914 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26765] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1915 (VGAM1915) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26766] VGAM1915 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1915 was detected is described hereinabove with reference to Figs. 2-8.

[26767] VGAM1915 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 3. VGAM1915 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26768] VGAM1915 gene, herein designated VGAM GENE, encodes a VGAM1915 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1915 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1915 precursor RNA is designated SEQ ID:1901, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1901 is located at position 225 relative to the genome of Human parainfluenza virus 3.

[26769] VGAM1915 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26770] An enzyme complex designated DICER COMPLEX, dices the VGAM1915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1915 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1915 RNA is designated SEQ ID:4626, and is provided hereinbelow with reference to the sequence listing part.

[26771] VGAM1915 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26772] VGAM1915 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1915 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26773] The complementary binding of VGAM1915 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1915 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26774] It is appreciated that VGAM1915 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1915 host target genes. The mRNA of each one of this plurality of VGAM1915 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1915 RNA, herein designated VGAM

RNA, and which when bound by VGAM1915 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1915 host target proteins.

[26775] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1915 gene, herein designated VGAM GENE, on one or more VGAM1915 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26776] It is yet further appreciated that a function of VGAM1915 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1915 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 3. Specific functions, and accordingly utilities, of VGAM1915 correlate with, and may be deduced from, the identity of the host target genes which VGAM1915 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26777] Nucleotide sequences of the VGAM1915 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1915 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1915 are further described hereinbelow with reference to Table 1.

[26778] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1915 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26779] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1916 (VGAM1916) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26780] VGAM1916 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1916 was detected is described hereinabove with reference to Figs. 2-8.

[26781] VGAM1916 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 1 strain Washington/1964. VGAM1916 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26782] VGAM1916 gene, herein designated VGAM GENE, encodes a VGAM1916 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1916 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1916 precursor RNA is designated SEQ ID:1902, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1902 is located at position 4687

relative to the genome of Human parainfluenza virus 1 strain Washington/1964.

[26783] VGAM1916 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26784] An enzyme complex designated DICER COMPLEX, dices the VGAM1916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1916 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1916 RNA is designated SEQ ID:4627, and is provided hereinbelow with reference to the sequence

listing part.

[26785] VGAM1916 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26786] VGAM1916 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1916 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1916 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26787] The complementary binding of VGAM1916 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1916 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26788] It is appreciated that VGAM1916 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1916 host target genes. The mRNA of each one of this plurality of VGAM1916 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1916 RNA, herein designated VGAM RNA, and which when bound by VGAM1916 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1916 host target proteins.

[26789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1916 gene, herein designated VGAM GENE, on one or more VGAM1916 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26790] It is yet further appreciated that a function of VGAM1916

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1916 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 1 strain Washington/1964. Specific functions, and accordingly utilities, of VGAM1916 correlate with, and may be deduced from, the identity of the host target genes which VGAM1916 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26791] Nucleotide sequences of the VGAM1916 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1916 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1916 are further described hereinbelow with reference to Table 1.

[26792] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1916 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26793] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1917 (VGAM1917) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26794] VGAM1917 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1917 was detected is described hereinabove with reference to Figs. 2-8.

[26795] VGAM1917 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 1 strain Washington/1964. VGAM1917 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26796] VGAM1917 gene, herein designated VGAM GENE, encodes a VGAM1917 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1917 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1917 precursor RNA is designated SEQ ID:1903, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1903 is located at position 14949 relative to the genome of Human parainfluenza virus 1 strain Washington/1964.

[26797] VGAM1917 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26798] An enzyme complex designated DICER COMPLEX, dices the VGAM1917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1917 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide se-

quence of VGAM1917 RNA is designated SEQ ID:4628, and is provided hereinbelow with reference to the sequence listing part.

[26799] VGAM1917 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26800] VGAM1917 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1917 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1917 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26801] The complementary binding of VGAM1917 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1917 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26802] It is appreciated that VGAM1917 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1917 host target genes. The mRNA of

each one of this plurality of VGAM1917 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1917 RNA, herein designated VGAM RNA, and which when bound by VGAM1917 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1917 host target proteins.

[26803] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1917 gene, herein designated VGAM GENE, on one or more VGAM1917 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[26804] It is yet further appreciated that a function of VGAM1917 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 1 strain Washington/1964. Specific functions, and accordingly utilities, of VGAM1917 correlate with, and may be deduced from, the identity of the host target genes which VGAM1917 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26805] Nucleotide sequences of the VGAM1917 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1917 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1917 are further described hereinbelow with reference to Table 1.

[26806] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1917 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[26807] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1918 (VGAM1918) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26808] VGAM1918 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1918 was detected is described hereinabove with reference to Figs. 2-8.

[26809] VGAM1918 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 1 strain Washington/1964. VGAM1918 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26810] VGAM1918 gene, herein designated VGAM GENE, encodes a VGAM1918 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1918 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1918 precursor RNA is designated SEQ ID:1904, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1904 is located at position 7051 relative to the genome of Human parainfluenza virus 1 strain Washington/1964.

[26811] VGAM1918 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26812] An enzyme complex designated DICER COMPLEX, dices the VGAM1918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1918 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1918 RNA is designated SEQ ID:4629, and is provided hereinbelow with reference to the sequence listing part.

[26813] VGAM1918 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26814] VGAM1918 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1918 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1918 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26815] The complementary binding of VGAM1918 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1918 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26816] It is appreciated that VGAM1918 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1918 host target genes. The mRNA of each one of this plurality of VGAM1918 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1918 RNA, herein designated VGAM RNA, and which when bound by VGAM1918 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1918 host target proteins.

[26817] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1918 gene, herein designated VGAM GENE, on one or more VGAM1918 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26818] It is yet further appreciated that a function of VGAM1918 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1918 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 1 strain Washington/1964. Specific functions, and accordingly utilities, of VGAM1918 correlate with, and may be deduced from, the identity of the host target genes which VGAM1918 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26819] Nucleotide sequences of the VGAM1918 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1918 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1918 are further described hereinbelow with reference to Table 1.

[26820] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1918 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26821] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1919 (VGAM1919) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26822] VGAM1919 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1919 was detected is described hereinabove with reference to Figs. 2-8.

[26823] VGAM1919 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1919 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26824] VGAM1919 gene, herein designated VGAM GENE, encodes a VGAM1919 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1919 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1919 precursor RNA is designated SEQ ID:1905, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1905 is located at position 109925 relative to the genome of Equine herpesvirus 1.

[26825] VGAM1919 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26826] An enzyme complex designated DICER COMPLEX, dices the VGAM1919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1919 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1919 RNA is designated SEQ ID:4630, and is provided hereinbelow with reference to the sequence listing part.

[26827] VGAM1919 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26828] VGAM1919 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1919 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1919 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26829] The complementary binding of VGAM1919 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1919 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26830] It is appreciated that VGAM1919 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1919 host target genes. The mRNA of each one of this plurality of VGAM1919 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1919 RNA, herein designated VGAM RNA, and which when bound by VGAM1919 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1919 host target proteins.

[26831] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1919 gene, herein designated VGAM GENE, on one or more VGAM1919 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26832] It is yet further appreciated that a function of VGAM1919 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1919 correlate with, and may be deduced from, the identity of the host target genes which VGAM1919 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26833] Nucleotide sequences of the VGAM1919 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1919 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1919 are further described hereinbelow with reference to Table 1.

[26834] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1919 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26835] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1920 (VGAM1920) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26836] VGAM1920 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1920 was detected is described hereinabove with reference to Figs. 2-8.

[26837] VGAM1920 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine distemper virus. VGAM1920 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26838] VGAM1920 gene, herein designated VGAM GENE, encodes a VGAM1920 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1920 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1920 precursor RNA is designated SEQ ID:1906, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1906 is located at position 12749 relative to the genome of Canine distemper virus.

[26839] VGAM1920 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26840] An enzyme complex designated DICER COMPLEX, dices the VGAM1920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1920 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1920 RNA is designated SEQ ID:4631, and is provided hereinbelow with reference to the sequence listing part.

[26841] VGAM1920 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26842] VGAM1920 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1920 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1920 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26843] The complementary binding of VGAM1920 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1920 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[26844] It is appreciated that VGAM1920 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1920 host target genes. The mRNA of each one of this plurality of VGAM1920 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1920 RNA, herein designated VGAM RNA, and which when bound by VGAM1920 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1920 host target proteins.

[26845] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1920 gene, herein designated VGAM GENE, on one or more VGAM1920 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26846] It is yet further appreciated that a function of VGAM1920 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1920 correlate with, and may be deduced from, the identity of the host target genes which VGAM1920 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26847] Nucleotide sequences of the VGAM1920 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1920 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1920 are further described hereinbelow with reference to Table 1.

[26848] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1920 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26849] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1921 (VGAM1921) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26850] VGAM1921 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1921 was detected is described hereinabove with reference to Figs. 2-8.

[26851] VGAM1921 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine distemper virus. VGAM1921 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26852] VGAM1921 gene, herein designated VGAM GENE, encodes a VGAM1921 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1921 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1921 precursor RNA is designated SEQ ID:1907, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1907 is located at position 9746 relative to the genome of Canine distemper virus.

[26853] VGAM1921 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26854] An enzyme complex designated DICER COMPLEX, dices the VGAM1921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1921 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1921 RNA is designated SEQ ID:4632, and is provided hereinbelow with reference to the sequence listing part.

[26855] VGAM1921 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26856] VGAM1921 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1921 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1921 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26857] The complementary binding of VGAM1921 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1921 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26858] It is appreciated that VGAM1921 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1921 host target genes. The mRNA of each one of this plurality of VGAM1921 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1921 RNA, herein designated VGAM RNA, and which when bound by VGAM1921 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1921 host target proteins.

[26859] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1921 gene, herein designated VGAM GENE, on one or more VGAM1921 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26860] It is yet further appreciated that a function of VGAM1921 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1921 correlate with, and may be deduced from, the identity of the host target genes which VGAM1921 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26861] Nucleotide sequences of the VGAM1921 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1921 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1921 are further described hereinbelow with reference to Table 1.

[26862] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1921 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26863] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1922 (VGAM1922) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26864] VGAM1922 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1922 was detected is described hereinabove with reference to Figs. 2-8.

[26865] VGAM1922 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine distemper virus. VGAM1922 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26866] VGAM1922 gene, herein designated VGAM GENE, encodes

a VGAM1922 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1922 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1922 precursor RNA is designated SEQ ID:1908, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1908 is located at position 11765 relative to the genome of Canine distemper virus.

[26867] VGAM1922 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26868] An enzyme complex designated DICER COMPLEX, dices the VGAM1922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1922 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1922 RNA is designated SEQ ID:4633, and is provided hereinbelow with reference to the sequence listing part.

[26869] VGAM1922 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26870] VGAM1922 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1922 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1922 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26871] The complementary binding of VGAM1922 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1922 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1922 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26872] It is appreciated that VGAM1922 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1922 host target genes. The mRNA of each one of this plurality of VGAM1922 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1922 RNA, herein designated VGAM RNA, and which when bound by VGAM1922 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1922 host target proteins.

[26873] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1922 gene, herein designated VGAM GENE, on one or more VGAM1922 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26874] It is yet further appreciated that a function of VGAM1922 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1922 correlate with, and may be deduced from, the identity of the host target genes which VGAM1922 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26875] Nucleotide sequences of the VGAM1922 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1922 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1922 are further

described hereinbelow with reference to Table 1.

[26876] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1922 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26877] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1923 (VGAM1923) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26878] VGAM1923 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1923 was detected is described hereinabove with reference to Figs. 2-8.

[26879] VGAM1923 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine distemper virus. VGAM1923 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26880] VGAM1923 gene, herein designated VGAM GENE, encodes a VGAM1923 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1923 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1923 precursor RNA is designated SEQ ID:1909, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1909 is located at position 3849 relative to the genome of Canine distemper virus.

[26881] VGAM1923 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26882] An enzyme complex designated DICER COMPLEX, dices the VGAM1923 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1923 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1923 RNA is designated SEQ ID:4634, and is provided hereinbelow with reference to the sequence listing part.

[26883] VGAM1923 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1923 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1923 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26884] VGAM1923 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1923 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1923 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1923 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26885] The complementary binding of VGAM1923 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1923 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1923

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1923 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26886] It is appreciated that VGAM1923 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1923 host target genes. The mRNA of each one of this plurality of VGAM1923 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1923 RNA, herein designated VGAM RNA, and which when bound by VGAM1923 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1923 host target proteins.

[26887] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1923 gene, herein designated VGAM GENE, on one or more VGAM1923 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26888] It is yet further appreciated that a function of VGAM1923 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1923 correlate with, and may be deduced from, the identity of the host target genes which VGAM1923 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26889] Nucleotide sequences of the VGAM1923 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1923 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1923 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1923 are further described hereinbelow with reference to Table 1.

[26890] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1923 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26891] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1924 (VGAM1924) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26892] VGAM1924 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1924 was detected is described hereinabove with reference to Figs. 2-8.

[26893] VGAM1924 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine distemper virus. VGAM1924 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[26894] VGAM1924 gene, herein designated VGAM GENE, encodes a VGAM1924 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1924 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1924 precursor RNA is designated SEQ ID:1910, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1910 is located at position 1287 relative to the genome of Canine distemper virus.

[26895] VGAM1924 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26896] An enzyme complex designated DICER COMPLEX, dices

the VGAM1924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1924 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1924 RNA is designated SEQ ID:4635, and is provided hereinbelow with reference to the sequence listing part.

[26897] VGAM1924 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26898] VGAM1924 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1924 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1924 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26899] The complementary binding of VGAM1924 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1924 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26900] It is appreciated that VGAM1924 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1924 host target genes. The mRNA of each one of this plurality of VGAM1924 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1924 RNA, herein designated VGAM RNA, and which when bound by VGAM1924 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1924 host target proteins.

[26901] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1924 gene, herein designated VGAM GENE, on one or more VGAM1924 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26902] It is yet further appreciated that a function of VGAM1924 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1924 correlate with, and may be deduced from, the identity of the host target genes which VGAM1924 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26903] Nucleotide sequences of the VGAM1924 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1924 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1924 are further described hereinbelow with reference to Table 1.

[26904] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1924 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26905] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1925 (VGAM1925) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26906] VGAM1925 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1925 was detected is described hereinabove with reference to Figs. 2-8.

[26907] VGAM1925 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine distemper virus. VGAM1925 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[26908] VGAM1925 gene, herein designated VGAM GENE, encodes a VGAM1925 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1925 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1925 precursor RNA is designated SEQ ID:1911, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1911 is located at position 5609 relative to the genome of Canine distemper virus.

[26909] VGAM1925 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26910] An enzyme complex designated DICER COMPLEX, dices the VGAM1925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1925 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1925 RNA is designated SEQ ID:4636, and is provided hereinbelow with reference to the sequence listing part.

[26911] VGAM1925 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26912] VGAM1925 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1925 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26913] The complementary binding of VGAM1925 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1925 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1925 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26914] It is appreciated that VGAM1925 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1925 host target genes. The mRNA of each one of this plurality of VGAM1925 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1925 RNA, herein designated VGAM RNA, and which when bound by VGAM1925 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1925 host target proteins.

[26915] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1925 gene, herein designated VGAM GENE, on one or more VGAM1925 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26916] It is yet further appreciated that a function of VGAM1925 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1925 correlate with, and may be deduced from, the identity of the host target genes which VGAM1925 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26917] Nucleotide sequences of the VGAM1925 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1925 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1925 are further described hereinbelow with reference to Table 1.

[26918] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1925 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26919] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1926 (VGAM1926) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26920] VGAM1926 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1926 was detected is described hereinabove with reference to Figs. 2-8.

[26921] VGAM1926 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine distemper virus.

VGAM1926 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26922] VGAM1926 gene, herein designated VGAM GENE, encodes a VGAM1926 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1926 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1926 precursor RNA is designated SEQ ID:1912, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1912 is located at position 8304 relative to the genome of Canine distemper virus.

[26923] VGAM1926 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[26924] An enzyme complex designated DICER COMPLEX, dices the VGAM1926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1926 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1926 RNA is designated SEQ ID:4637, and is provided hereinbelow with reference to the sequence listing part.

[26925] VGAM1926 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26926] VGAM1926 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1926 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1926 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26927] The complementary binding of VGAM1926 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1926 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26928] It is appreciated that VGAM1926 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1926 host target genes. The mRNA of each one of this plurality of VGAM1926 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1926 RNA, herein designated VGAM RNA, and which when bound by VGAM1926 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1926 host target proteins.

[26929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1926 gene, herein designated VGAM GENE, on one or more VGAM1926 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26930] It is yet further appreciated that a function of VGAM1926 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1926 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1926 correlate with, and may be deduced from, the identity of the host target genes which VGAM1926 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26931] Nucleotide sequences of the VGAM1926 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1926 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1926 are further described hereinbelow with reference to Table 1.

[26932] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1926 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26933] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1927 (VGAM1927) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26934] VGAM1927 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1927 was detected is described hereinabove with reference to Figs. 2-8.

[26935] VGAM1927 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Canine distemper virus. VGAM1927 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26936] VGAM1927 gene, herein designated VGAM GENE, encodes a VGAM1927 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1927 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1927 precursor RNA is designated SEQ ID:1913, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1913 is located at position 9614 relative to the genome of Canine distemper virus.

[26937] VGAM1927 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26938] An enzyme complex designated DICER COMPLEX, dices the VGAM1927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1927 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1927 RNA is designated SEQ ID:4638, and is provided hereinbelow with reference to the sequence listing part.

[26939] VGAM1927 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1927 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1927 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26940] VGAM1927 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1927 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1927 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1927 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1927 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26941] The complementary binding of VGAM1927 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1927 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1927 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1927 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26942] It is appreciated that VGAM1927 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1927 host target genes. The mRNA of each one of this plurality of VGAM1927 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1927 RNA, herein designated VGAM RNA, and which when bound by VGAM1927 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1927 host target proteins.

[26943] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1927 gene, herein designated VGAM GENE, on one or more VGAM1927 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26944] It is yet further appreciated that a function of VGAM1927 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1927 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1927 correlate with, and may be deduced from, the identity of the host target genes which VGAM1927 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26945] Nucleotide sequences of the VGAM1927 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1927 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1927 are further described hereinbelow with reference to Table 1.

[26946] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1927 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26947] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1928 (VGAM1928) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26948] VGAM1928 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1928 was detected is described hereinabove with reference to Figs. 2-8.

[26949] VGAM1928 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine distemper virus. VGAM1928 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26950] VGAM1928 gene, herein designated VGAM GENE, encodes a VGAM1928 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1928 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1928 precursor RNA is designated SEQ ID:1914, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1914 is located at position 5392 relative to the genome of Canine distemper virus.

[26951] VGAM1928 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26952] An enzyme complex designated DICER COMPLEX, dices the VGAM1928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1928 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1928 RNA is designated SEQ ID:4639, and is provided hereinbelow with reference to the sequence listing part.

[26953] VGAM1928 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[26954] VGAM1928 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1928 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26955] The complementary binding of VGAM1928 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1928 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26956] It is appreciated that VGAM1928 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1928 host target genes. The mRNA of each one of this plurality of VGAM1928 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1928 RNA, herein designated VGAM RNA, and which when bound by VGAM1928 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1928 host target proteins.

[26957] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1928 gene, herein designated VGAM GENE, on one

or more VGAM1928 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26958] It is yet further appreciated that a function of VGAM1928 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of viral infection by Canine distemper virus. Specific functions, and accordingly utilities, of VGAM1928 correlate with, and may be deduced from, the identity of the host target genes which VGAM1928 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26959] Nucleotide sequences of the VGAM1928 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1928 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1928 are further described hereinbelow with reference to Table 1.

[26960] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1928 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26961] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1929 (VGAM1929) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26962] VGAM1929 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1929 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[26963] VGAM1929 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Simian hemorrhagic fever virus. VGAM1929 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26964] VGAM1929 gene, herein designated VGAM GENE, encodes a VGAM1929 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1929 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1929 precursor RNA is designated SEQ ID:1915, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1915 is located at position 11778 relative to the genome of Simian hemorrhagic fever virus.

[26965] VGAM1929 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26966] An enzyme complex designated DICER COMPLEX, dices the VGAM1929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1929 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1929 RNA is designated SEQ ID:4640, and is provided hereinbelow with reference to the sequence listing part.

[26967] VGAM1929 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26968] VGAM1929 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1929 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26969] The complementary binding of VGAM1929 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1929 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26970] It is appreciated that VGAM1929 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1929 host target genes. The mRNA of each one of this plurality of VGAM1929 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1929 RNA, herein designated VGAM RNA, and which when bound by VGAM1929 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1929 host target proteins.

[26971] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1929 gene, herein designated VGAM GENE, on one or more VGAM1929 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26972] It is yet further appreciated that a function of VGAM1929 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of viral infection by Simian hemorrhagic fever virus. Specific functions, and accordingly utilities, of VGAM1929 correlate with, and may be deduced from, the identity of the host target genes which VGAM1929 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26973] Nucleotide sequences of the VGAM1929 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1929 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1929 are further described hereinbelow with reference to Table 1.

[26974] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1929 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26975] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1930 (VGAM1930) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26976] VGAM1930 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1930 was detected is described hereinabove with reference to Figs. 2-8.

[26977] VGAM1930 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1930 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26978] VGAM1930 gene, herein designated VGAM GENE, encodes a VGAM1930 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1930 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1930 precursor RNA is designated SEQ ID:1916, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1916 is located at position 150946 relative to the genome of Human herpesvirus 4.

[26979] VGAM1930 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26980] An enzyme complex designated DICER COMPLEX, dices the VGAM1930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1930 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1930 RNA is designated SEQ ID:4641, and is provided hereinbelow with reference to the sequence listing part.

[26981] VGAM1930 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26982] VGAM1930 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1930 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26983] The complementary binding of VGAM1930 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1930 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26984] It is appreciated that VGAM1930 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1930 host target genes. The mRNA of each one of this plurality of VGAM1930 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1930 RNA, herein designated VGAM RNA, and which when bound by VGAM1930 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1930 host target proteins.

[26985] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1930 gene, herein designated VGAM GENE, on one or more VGAM1930 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26986] It is yet further appreciated that a function of VGAM1930 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1930 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1930 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26987] Nucleotide sequences of the VGAM1930 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1930 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1930 are further described hereinbelow with reference to Table 1.

[26988] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1930 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26989] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1931 (VGAM1931) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26990] VGAM1931 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1931 was detected is described hereinabove with reference to Figs. 2-8.

[26991] VGAM1931 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1931 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26992] VGAM1931 gene, herein designated VGAM GENE, encodes a VGAM1931 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1931 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1931 precursor RNA is designated SEQ ID:1917, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1917 is located at position 151629 relative to the genome of Human herpesvirus 4.

[26993] VGAM1931 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1931 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26994] An enzyme complex designated DICER COMPLEX, dices the VGAM1931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1931 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1931 RNA is designated SEQ ID:4642, and is provided hereinbelow with reference to the sequence listing part.

[26995] VGAM1931 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1931 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26996] VGAM1931 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1931 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26997] The complementary binding of VGAM1931 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1931 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26998] It is appreciated that VGAM1931 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1931 host target genes. The mRNA of each one of this plurality of VGAM1931 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1931 RNA, herein designated VGAM RNA, and which when bound by VGAM1931 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1931 host target proteins.

[26999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1931 gene, herein designated VGAM GENE, on one or more VGAM1931 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27000] It is yet further appreciated that a function of VGAM1931 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1931

correlate with, and may be deduced from, the identity of the host target genes which VGAM1931 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27001] Nucleotide sequences of the VGAM1931 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1931 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1931 are further described hereinbelow with reference to Table 1.

[27002] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1931 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27003] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1932 (VGAM1932) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[27004] VGAM1932 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1932 was detected is described hereinabove with reference to Figs. 2-8.

[27005] VGAM1932 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1932 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27006] VGAM1932 gene, herein designated VGAM GENE, encodes a VGAM1932 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1932 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1932 precursor RNA is designated SEQ ID:1918, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1918 is located at position 159902 relative to the genome of Human herpesvirus 4.

[27007] VGAM1932 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1932 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27008] An enzyme complex designated DICER COMPLEX, dices the VGAM1932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1932 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1932 RNA is designated SEQ ID:4643, and is provided hereinbelow with reference to the sequence listing part.

[27009] VGAM1932 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1932 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27010] VGAM1932 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1932 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27011] The complementary binding of VGAM1932 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1932 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27012] It is appreciated that VGAM1932 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1932 host target genes. The mRNA of each one of this plurality of VGAM1932 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1932 RNA, herein designated VGAM RNA, and which when bound by VGAM1932 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1932 host target proteins.

[27013] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1932 gene, herein designated VGAM GENE, on one or more VGAM1932 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27014] It is yet further appreciated that a function of VGAM1932 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM1932 correlate with, and may be deduced from, the identity of the host target genes which VGAM1932 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27015] Nucleotide sequences of the VGAM1932 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1932 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1932 are further described hereinbelow with reference to Table 1.

[27016] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1932 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27017] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1933 (VGAM1933) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[27018] VGAM1933 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1933 was detected is described hereinabove with reference to Figs. 2-8.

[27019] VGAM1933 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1933 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27020] VGAM1933 gene, herein designated VGAM GENE, encodes a VGAM1933 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1933 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1933 precursor RNA is designated SEQ ID:1919, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1919 is located at position 156037 relative to the genome of Human herpesvirus 4.

[27021] VGAM1933 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27022] An enzyme complex designated DICER COMPLEX, dices the VGAM1933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1933 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1933 RNA is designated SEQ ID:4644, and is provided hereinbelow with reference to the sequence listing part.

[27023] VGAM1933 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27024] VGAM1933 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1933 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1933 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27025] The complementary binding of VGAM1933 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1933 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27026] It is appreciated that VGAM1933 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1933 host target genes. The mRNA of each one of this plurality of VGAM1933 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1933 RNA, herein designated VGAM RNA, and which when bound by VGAM1933 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1933 host target proteins.

[27027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1933 gene, herein designated VGAM GENE, on one or more VGAM1933 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27028] It is yet further appreciated that a function of VGAM1933 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1933 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1933 correlate with, and may be deduced from, the identity of the host target genes which VGAM1933 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27029] Nucleotide sequences of the VGAM1933 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1933 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1933 are further described hereinbelow with reference to Table 1.

[27030] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1933 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27031] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1934 (VGAM1934) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27032] VGAM1934 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1934 was detected is described hereinabove with reference to Figs. 2-8.

[27033] VGAM1934 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1934 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27034] VGAM1934 gene, herein designated VGAM GENE, encodes a VGAM1934 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1934 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1934 precursor RNA is designated SEQ ID:1920, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1920 is located at position 157308 relative to the genome of Human herpesvirus 4.

[27035] VGAM1934 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27036] An enzyme complex designated DICER COMPLEX, dices the VGAM1934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1934 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1934 RNA is designated SEQ ID:4645, and is provided hereinbelow with reference to the sequence listing part.

[27037] VGAM1934 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27038] VGAM1934 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1934 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27039] The complementary binding of VGAM1934 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1934 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27040] It is appreciated that VGAM1934 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1934 host target genes. The mRNA of each one of this plurality of VGAM1934 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1934 RNA, herein designated VGAM

RNA, and which when bound by VGAM1934 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1934 host target proteins.

[27041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1934 gene, herein designated VGAM GENE, on one or more VGAM1934 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27042] It is yet further appreciated that a function of VGAM1934 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1934 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1934 correlate with, and may be deduced from, the identity of the host target genes which VGAM1934 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27043] Nucleotide sequences of the VGAM1934 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1934 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1934 are further described hereinbelow with reference to Table 1.

[27044] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1934 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27045] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1935 (VGAM1935) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27046] VGAM1935 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1935 was detected is described hereinabove with reference to Figs. 2-8.

[27047] VGAM1935 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1935 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27048] VGAM1935 gene, herein designated VGAM GENE, encodes a VGAM1935 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1935 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1935 precursor RNA is designated SEQ ID:1921, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1921 is located at position

155556 relative to the genome of Human herpesvirus 4.

[27049] VGAM1935 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27050] An enzyme complex designated DICER COMPLEX, dices the VGAM1935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1935 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1935 RNA is designated SEQ ID:4646, and is provided hereinbelow with reference to the sequence listing part.

[27051] VGAM1935 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27052] VGAM1935 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1935 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27053] The complementary binding of VGAM1935 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1935 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27054] It is appreciated that VGAM1935 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1935 host target genes. The mRNA of each one of this plurality of VGAM1935 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1935 RNA, herein designated VGAM RNA, and which when bound by VGAM1935 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1935 host target proteins.

[27055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1935 gene, herein designated VGAM GENE, on one or more VGAM1935 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27056] It is yet further appreciated that a function of VGAM1935 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1935 correlate with, and may be deduced from, the identity of the host target genes which VGAM1935 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27057] Nucleotide sequences of the VGAM1935 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1935 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1935 are further described hereinbelow with reference to Table 1.

[27058] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1935 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27059] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1936 (VGAM1936) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27060] VGAM1936 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1936 was detected is described hereinabove with reference to Figs. 2-8.

[27061] VGAM1936 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1936 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27062] VGAM1936 gene, herein designated VGAM GENE, encodes a VGAM1936 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1936 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1936 precursor RNA is designated SEQ ID:1922, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1922 is located at position 152064 relative to the genome of Human herpesvirus 4.

[27063] VGAM1936 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27064] An enzyme complex designated DICER COMPLEX, dices the VGAM1936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1936 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1936 RNA is designated SEQ ID:4647, and is provided hereinbelow with reference to the sequence

listing part.

[27065] VGAM1936 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27066] VGAM1936 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1936 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27067] The complementary binding of VGAM1936 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1936 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27068] It is appreciated that VGAM1936 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1936 host target genes. The mRNA of each one of this plurality of VGAM1936 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1936 RNA, herein designated VGAM RNA, and which when bound by VGAM1936 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1936 host target proteins.

[27069] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1936 gene, herein designated VGAM GENE, on one or more VGAM1936 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27070] It is yet further appreciated that a function of VGAM1936

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1936 correlate with, and may be deduced from, the identity of the host target genes which VGAM1936 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27071] Nucleotide sequences of the VGAM1936 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1936 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1936 are further described hereinbelow with reference to Table 1.

[27072] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1936 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27073] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1937 (VGAM1937) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27074] VGAM1937 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1937 was detected is described hereinabove with reference to Figs. 2-8.

[27075] VGAM1937 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1937 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27076] VGAM1937 gene, herein designated VGAM GENE, encodes a VGAM1937 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1937 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1937 precursor RNA is designated SEQ ID:1923, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1923 is located at position 161986 relative to the genome of Human herpesvirus 4.

[27077] VGAM1937 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27078] An enzyme complex designated DICER COMPLEX, dices the VGAM1937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1937 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1937 RNA is designated SEQ ID:4648, and

is provided hereinbelow with reference to the sequence listing part.

[27079] VGAM1937 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27080] VGAM1937 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1937 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27081] The complementary binding of VGAM1937 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1937 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27082] It is appreciated that VGAM1937 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1937 host target genes. The mRNA of each one of this plurality of VGAM1937 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1937 RNA, herein designated VGAM RNA, and which when bound by VGAM1937 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1937 host target proteins.

[27083] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1937 gene, herein designated VGAM GENE, on one or more VGAM1937 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27084] It is yet further appreciated that a function of VGAM1937 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1937 correlate with, and may be deduced from, the identity of the host target genes which VGAM1937 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27085] Nucleotide sequences of the VGAM1937 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1937 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1937 are further described hereinbelow with reference to Table 1.

[27086] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1937 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27087] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1938 (VGAM1938) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27088] VGAM1938 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1938 was detected is described hereinabove with reference to Figs. 2-8.

[27089] VGAM1938 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1938 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27090] VGAM1938 gene, herein designated VGAM GENE, encodes a VGAM1938 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1938 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1938 precur-

sor RNA is designated SEQ ID:1924, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1924 is located at position 151796 relative to the genome of Human herpesvirus 4.

[27091] VGAM1938 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27092] An enzyme complex designated DICER COMPLEX, dices the VGAM1938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1938 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide se-

quence of VGAM1938 RNA is designated SEQ ID:4649, and is provided hereinbelow with reference to the sequence listing part.

[27093] VGAM1938 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27094] VGAM1938 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1938 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1938 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27095] The complementary binding of VGAM1938 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1938 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27096] It is appreciated that VGAM1938 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1938 host target genes. The mRNA of

each one of this plurality of VGAM1938 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1938 RNA, herein designated VGAM RNA, and which when bound by VGAM1938 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1938 host target proteins.

[27097] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1938 gene, herein designated VGAM GENE, on one or more VGAM1938 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[27098] It is yet further appreciated that a function of VGAM1938 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1938 correlate with, and may be deduced from, the identity of the host target genes which VGAM1938 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27099] Nucleotide sequences of the VGAM1938 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1938 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1938 are further described hereinbelow with reference to Table 1.

[27100] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1938 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[27101] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1939 (VGAM1939) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27102] VGAM1939 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1939 was detected is described hereinabove with reference to Figs. 2-8.

[27103] VGAM1939 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Measles virus.
VGAM1939 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27104] VGAM1939 gene, herein designated VGAM GENE, encodes a VGAM1939 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1939 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1939 precursor RNA is designated SEQ ID:1925, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1925 is located at position 15073 relative to the genome of Measles virus.

[27105] VGAM1939 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27106] An enzyme complex designated DICER COMPLEX, dices the VGAM1939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1939 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1939 RNA is designated SEQ ID:4650, and is provided hereinbelow with reference to the sequence listing part.

[27107] VGAM1939 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27108] VGAM1939 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1939 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1939 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27109] The complementary binding of VGAM1939 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1939 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27110] It is appreciated that VGAM1939 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1939 host target genes. The mRNA of each one of this plurality of VGAM1939 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1939 RNA, herein designated VGAM RNA, and which when bound by VGAM1939 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1939 host target proteins.

[27111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1939 gene, herein designated VGAM GENE, on one or more VGAM1939 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27112] It is yet further appreciated that a function of VGAM1939 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1939 include diagnosis, prevention and treatment of viral infection by Measles virus. Specific functions, and accordingly utilities, of VGAM1939 correlate with, and may be deduced from, the identity of the host target genes which VGAM1939 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27113] Nucleotide sequences of the VGAM1939 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1939 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1939 are further described hereinbelow with reference to Table 1.

[27114] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1939 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27115] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1940 (VGAM1940) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27116] VGAM1940 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1940 was detected is described hereinabove with reference to Figs. 2-8.

[27117] VGAM1940 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1940 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27118] VGAM1940 gene, herein designated VGAM GENE, encodes a VGAM1940 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1940 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1940 precursor RNA is designated SEQ ID:1926, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1926 is located at position 17783 relative to the genome of Variola virus.

[27119] VGAM1940 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27120] An enzyme complex designated DICER COMPLEX, dices the VGAM1940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1940 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1940 RNA is designated SEQ ID:4651, and is provided hereinbelow with reference to the sequence listing part.

[27121] VGAM1940 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27122] VGAM1940 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1940 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1940 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27123] The complementary binding of VGAM1940 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1940 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27124] It is appreciated that VGAM1940 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1940 host target genes. The mRNA of each one of this plurality of VGAM1940 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1940 RNA, herein designated VGAM RNA, and which when bound by VGAM1940 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1940 host target proteins.

[27125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1940 gene, herein designated VGAM GENE, on one or more VGAM1940 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27126] It is yet further appreciated that a function of VGAM1940 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1940 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1940 correlate with, and may be deduced from, the identity of the host target genes which VGAM1940 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27127] Nucleotide sequences of the VGAM1940 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1940 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1940 are further described hereinbelow with reference to Table 1.

[27128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1940 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27129] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1941 (VGAM1941) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27130] VGAM1941 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1941 was detected is described hereinabove with reference to Figs. 2-8.

[27131] VGAM1941 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1941 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27132] VGAM1941 gene, herein designated VGAM GENE, encodes a VGAM1941 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1941 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1941 precursor RNA is designated SEQ ID:1927, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1927 is located at position 17196 relative to the genome of Variola virus.

[27133] VGAM1941 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27134] An enzyme complex designated DICER COMPLEX, dices the VGAM1941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1941 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1941 RNA is designated SEQ ID:4652, and is provided hereinbelow with reference to the sequence listing part.

[27135] VGAM1941 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27136] VGAM1941 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1941 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27137] The complementary binding of VGAM1941 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1941 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27138] It is appreciated that VGAM1941 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1941 host target genes. The mRNA of each one of this plurality of VGAM1941 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1941 RNA, herein designated VGAM RNA, and which when bound by VGAM1941 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1941 host target proteins.

[27139] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1941 gene, herein designated VGAM GENE, on one or more VGAM1941 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27140] It is yet further appreciated that a function of VGAM1941 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1941 correlate with, and may be deduced from, the identity of the host target genes which VGAM1941 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27141] Nucleotide sequences of the VGAM1941 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1941 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1941 are further described hereinbelow with reference to Table 1.

[27142] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1941 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27143] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1942 (VGAM1942) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27144] VGAM1942 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1942 was detected is described hereinabove with reference to Figs. 2-8.

[27145] VGAM1942 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1942 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27146] VGAM1942 gene, herein designated VGAM GENE, encodes a VGAM1942 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1942 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1942 precursor RNA is designated SEQ ID:1928, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1928 is located at position 17313 relative to the genome of Variola virus.

[27147] VGAM1942 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27148] An enzyme complex designated DICER COMPLEX, dices the VGAM1942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1942 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1942 RNA is designated SEQ ID:4653, and is provided hereinbelow with reference to the sequence listing part.

[27149] VGAM1942 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27150] VGAM1942 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1942 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1942 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27151] The complementary binding of VGAM1942 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1942 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27152] It is appreciated that VGAM1942 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1942 host target genes. The mRNA of each one of this plurality of VGAM1942 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1942 RNA, herein designated VGAM RNA, and which when bound by VGAM1942 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1942 host target proteins.

[27153] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1942 gene, herein designated VGAM GENE, on one or more VGAM1942 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27154] It is yet further appreciated that a function of VGAM1942 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1942 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1942 correlate with, and may be deduced from, the identity of the host target genes which VGAM1942 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27155] Nucleotide sequences of the VGAM1942 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1942 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1942 are further described hereinbelow with reference to Table 1.

[27156] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1942 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27157] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1943 (VGAM1943) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27158] VGAM1943 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1943 was detected is described hereinabove with reference to Figs. 2-8.

[27159] VGAM1943 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1943 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27160] VGAM1943 gene, herein designated VGAM GENE, encodes a VGAM1943 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1943 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1943 precursor RNA is designated SEQ ID:1929, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1929 is located at position 6220 relative to the genome of Variola virus.

[27161] VGAM1943 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27162] An enzyme complex designated DICER COMPLEX, dices the VGAM1943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1943 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1943 RNA is designated SEQ ID:4654, and is provided hereinbelow with reference to the sequence listing part.

[27163] VGAM1943 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27164] VGAM1943 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1943 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1943 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27165] The complementary binding of VGAM1943 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1943 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27166] It is appreciated that VGAM1943 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1943 host target genes. The mRNA of each one of this plurality of VGAM1943 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1943 RNA, herein designated VGAM RNA, and which when bound by VGAM1943 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1943 host target proteins.

[27167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1943 gene, herein designated VGAM GENE, on one or more VGAM1943 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27168] It is yet further appreciated that a function of VGAM1943 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1943 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1943 correlate with, and may be deduced from, the identity of the host target genes which VGAM1943 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27169] Nucleotide sequences of the VGAM1943 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1943 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1943 are further described hereinbelow with reference to Table 1.

[27170] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1943 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27171] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1944 (VGAM1944) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27172] VGAM1944 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1944 was detected is described hereinabove with reference to Figs. 2-8.

[27173] VGAM1944 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1944 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27174] VGAM1944 gene, herein designated VGAM GENE, encodes a VGAM1944 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1944 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1944 precursor RNA is designated SEQ ID:1930, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1930 is located at position 4789 relative to the genome of Variola virus.

[27175] VGAM1944 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27176] An enzyme complex designated DICER COMPLEX, dices the VGAM1944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1944 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1944 RNA is designated SEQ ID:4655, and is provided hereinbelow with reference to the sequence listing part.

[27177] VGAM1944 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27178] VGAM1944 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1944 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27179] The complementary binding of VGAM1944 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1944 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27180] It is appreciated that VGAM1944 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1944 host target genes. The mRNA of each one of this plurality of VGAM1944 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1944 RNA, herein designated VGAM RNA, and which when bound by VGAM1944 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1944 host target proteins.

[27181] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1944 gene, herein designated VGAM GENE, on one or more VGAM1944 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27182] It is yet further appreciated that a function of VGAM1944 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1944 correlate with, and may be deduced from, the identity of the host target genes which VGAM1944 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27183] Nucleotide sequences of the VGAM1944 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1944 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1944 are further described hereinbelow with reference to Table 1.

[27184] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1944 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27185] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1945 (VGAM1945) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27186] VGAM1945 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1945 was detected is described hereinabove with reference to Figs. 2-8.

[27187] VGAM1945 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1945 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27188] VGAM1945 gene, herein designated VGAM GENE, encodes a VGAM1945 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1945 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1945 precursor RNA is designated SEQ ID:1931, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1931 is located at position 7746 relative to the genome of Variola virus.

[27189] VGAM1945 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27190] An enzyme complex designated DICER COMPLEX, dices the VGAM1945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1945 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1945 RNA is designated SEQ ID:4656, and is provided hereinbelow with reference to the sequence listing part.

[27191] VGAM1945 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27192] VGAM1945 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1945 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1945 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27193] The complementary binding of VGAM1945 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1945 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27194] It is appreciated that VGAM1945 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1945 host target genes. The mRNA of each one of this plurality of VGAM1945 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1945 RNA, herein designated VGAM RNA, and which when bound by VGAM1945 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1945 host target proteins.

[27195] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1945 gene, herein designated VGAM GENE, on one or more VGAM1945 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27196] It is yet further appreciated that a function of VGAM1945 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1945 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1945 correlate with, and may be deduced from, the identity of the host target genes which VGAM1945 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27197] Nucleotide sequences of the VGAM1945 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1945 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1945 are further described hereinbelow with reference to Table 1.

[27198] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1945 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27199] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1946 (VGAM1946) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27200] VGAM1946 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1946 was detected is described hereinabove with reference to Figs. 2-8.

[27201] VGAM1946 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1946 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27202] VGAM1946 gene, herein designated VGAM GENE, encodes a VGAM1946 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1946 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1946 precursor RNA is designated SEQ ID:1932, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1932 is located at position 11538 relative to the genome of Variola virus.

[27203] VGAM1946 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27204] An enzyme complex designated DICER COMPLEX, dices the VGAM1946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1946 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1946 RNA is designated SEQ ID:4657, and is provided hereinbelow with reference to the sequence listing part.

[27205] VGAM1946 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27206] VGAM1946 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1946 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27207] The complementary binding of VGAM1946 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1946 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27208] It is appreciated that VGAM1946 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1946 host target genes. The mRNA of each one of this plurality of VGAM1946 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1946 RNA, herein designated VGAM RNA, and which when bound by VGAM1946 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1946 host target proteins.

[27209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1946 gene, herein designated VGAM GENE, on one or more VGAM1946 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27210] It is yet further appreciated that a function of VGAM1946 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1946 correlate with, and may be deduced from, the identity of the host target genes which VGAM1946 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27211] Nucleotide sequences of the VGAM1946 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1946 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1946 are further described hereinbelow with reference to Table 1.

[27212] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1946 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27213] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1947 (VGAM1947) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27214] VGAM1947 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1947 was detected is described hereinabove with reference to Figs. 2-8.

[27215] VGAM1947 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1947 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27216] VGAM1947 gene, herein designated VGAM GENE, encodes a VGAM1947 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1947 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1947 precursor RNA is designated SEQ ID:1933, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1933 is located at position 16704 relative to the genome of Variola virus.

[27217] VGAM1947 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27218] An enzyme complex designated DICER COMPLEX, dices the VGAM1947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1947 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 68%) nucleotide sequence of VGAM1947 RNA is designated SEQ ID:4658, and is provided hereinbelow with reference to the sequence listing part.

[27219] VGAM1947 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27220] VGAM1947 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1947 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1947 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27221] The complementary binding of VGAM1947 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1947 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27222] It is appreciated that VGAM1947 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1947 host target genes. The mRNA of each one of this plurality of VGAM1947 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1947 RNA, herein designated VGAM RNA, and which when bound by VGAM1947 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1947 host target proteins.

[27223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1947 gene, herein designated VGAM GENE, on one or more VGAM1947 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27224] It is yet further appreciated that a function of VGAM1947 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1947 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1947 correlate with, and may be deduced from, the identity of the host target genes which VGAM1947 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27225] Nucleotide sequences of the VGAM1947 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1947 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1947 are further described hereinbelow with reference to Table 1.

[27226] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1947 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27227] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1948 (VGAM1948) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27228] VGAM1948 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1948 was detected is described hereinabove with reference to Figs. 2-8.

[27229] VGAM1948 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM1948 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27230] VGAM1948 gene, herein designated VGAM GENE, encodes a VGAM1948 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1948 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1948 precursor RNA is designated SEQ ID:1934, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1934 is located at position 4256 relative to the genome of Avian paramyxovirus 6.

[27231] VGAM1948 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27232] An enzyme complex designated DICER COMPLEX, dices the VGAM1948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1948 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1948 RNA is designated SEQ ID:4659, and is provided hereinbelow with reference to the sequence listing part.

[27233] VGAM1948 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27234] VGAM1948 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1948 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27235] The complementary binding of VGAM1948 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1948 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27236] It is appreciated that VGAM1948 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1948 host target genes. The mRNA of each one of this plurality of VGAM1948 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1948 RNA, herein designated VGAM RNA, and which when bound by VGAM1948 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1948 host target proteins.

[27237] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1948 gene, herein designated VGAM GENE, on one or more VGAM1948 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27238] It is yet further appreciated that a function of VGAM1948 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1948 correlate with, and may be deduced from, the identity of the host target genes which VGAM1948 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27239] Nucleotide sequences of the VGAM1948 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1948 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1948 are further described hereinbelow with reference to Table 1.

[27240] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1948 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27241] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1949 (VGAM1949) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27242] VGAM1949 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1949 was detected is described hereinabove with reference to Figs. 2-8.

[27243] VGAM1949 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM1949 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27244] VGAM1949 gene, herein designated VGAM GENE, encodes a VGAM1949 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1949 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1949 precursor RNA is designated SEQ ID:1935, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1935 is located at position 14249 relative to the genome of Avian paramyxovirus 6.

[27245] VGAM1949 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27246] An enzyme complex designated DICER COMPLEX, dices the VGAM1949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1949 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1949 RNA is designated SEQ ID:4660, and is provided hereinbelow with reference to the sequence listing part.

[27247] VGAM1949 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27248] VGAM1949 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1949 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1949 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27249] The complementary binding of VGAM1949 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1949 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27250] It is appreciated that VGAM1949 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1949 host target genes. The mRNA of each one of this plurality of VGAM1949 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1949 RNA, herein designated VGAM RNA, and which when bound by VGAM1949 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1949 host target proteins.

[27251] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1949 gene, herein designated VGAM GENE, on one or more VGAM1949 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27252] It is yet further appreciated that a function of VGAM1949 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1949 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1949 correlate with, and may be deduced from, the identity of the host target genes which VGAM1949 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27253] Nucleotide sequences of the VGAM1949 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1949 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1949 are further described hereinbelow with reference to Table 1.

[27254] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1949 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27255] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1950 (VGAM1950) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27256] VGAM1950 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1950 was detected is described hereinabove with reference to Figs. 2-8.

[27257] VGAM1950 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM1950 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27258] VGAM1950 gene, herein designated VGAM GENE, encodes a VGAM1950 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1950 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1950 precursor RNA is designated SEQ ID:1936, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1936 is located at position 14024 relative to the genome of Avian paramyxovirus 6.

[27259] VGAM1950 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27260] An enzyme complex designated DICER COMPLEX, dices the VGAM1950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1950 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1950 RNA is designated SEQ ID:4661, and is provided hereinbelow with reference to the sequence listing part.

[27261] VGAM1950 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27262] VGAM1950 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1950 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27263] The complementary binding of VGAM1950 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1950 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[27264] It is appreciated that VGAM1950 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1950 host target genes. The mRNA of each one of this plurality of VGAM1950 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1950 RNA, herein designated VGAM RNA, and which when bound by VGAM1950 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1950 host target proteins.

[27265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1950 gene, herein designated VGAM GENE, on one or more VGAM1950 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27266] It is yet further appreciated that a function of VGAM1950 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1950 correlate with, and may be deduced from, the identity of the host target genes which VGAM1950 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27267] Nucleotide sequences of the VGAM1950 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1950 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1950 are further described hereinbelow with reference to Table 1.

[27268] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1950 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27269] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1951 (VGAM1951) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27270] VGAM1951 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1951 was detected is described hereinabove with reference to Figs. 2-8.

[27271] VGAM1951 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM1951 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27272] VGAM1951 gene, herein designated VGAM GENE, encodes a VGAM1951 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1951 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1951 precursor RNA is designated SEQ ID:1937, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1937 is located at position 5552 relative to the genome of Avian paramyxovirus 6.

[27273] VGAM1951 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27274] An enzyme complex designated DICER COMPLEX, dices the VGAM1951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1951 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1951 RNA is designated SEQ ID:4662, and is provided hereinbelow with reference to the sequence listing part.

[27275] VGAM1951 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27276] VGAM1951 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1951 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1951 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27277] The complementary binding of VGAM1951 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1951 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27278] It is appreciated that VGAM1951 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1951 host target genes. The mRNA of each one of this plurality of VGAM1951 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1951 RNA, herein designated VGAM RNA, and which when bound by VGAM1951 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1951 host target proteins.

[27279] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1951 gene, herein designated VGAM GENE, on one or more VGAM1951 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27280] It is yet further appreciated that a function of VGAM1951 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1951 correlate with, and may be deduced from, the identity of the host target genes which VGAM1951 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27281] Nucleotide sequences of the VGAM1951 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1951 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1951 are further described hereinbelow with reference to Table 1.

[27282] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1951 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27283] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1952 (VGAM1952) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27284] VGAM1952 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1952 was detected is described hereinabove with reference to Figs. 2-8.

[27285] VGAM1952 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM1952 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27286] VGAM1952 gene, herein designated VGAM GENE, encodes

a VGAM1952 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1952 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1952 precursor RNA is designated SEQ ID:1938, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1938 is located at position 12992 relative to the genome of Avian paramyxovirus 6.

[27287] VGAM1952 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27288] An enzyme complex designated DICER COMPLEX, dices the VGAM1952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1952 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1952 RNA is designated SEQ ID:4663, and is provided hereinbelow with reference to the sequence listing part.

[27289] VGAM1952 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27290] VGAM1952 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1952 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27291] The complementary binding of VGAM1952 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1952 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1952 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27292] It is appreciated that VGAM1952 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1952 host target genes. The mRNA of each one of this plurality of VGAM1952 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1952 RNA, herein designated VGAM RNA, and which when bound by VGAM1952 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1952 host target proteins.

[27293] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1952 gene, herein designated VGAM GENE, on one or more VGAM1952 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27294] It is yet further appreciated that a function of VGAM1952 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1952 correlate with, and may be deduced from, the identity of the host target genes which VGAM1952 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27295] Nucleotide sequences of the VGAM1952 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1952 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1952 are further

described hereinbelow with reference to Table 1.

[27296] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1952 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27297] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1953 (VGAM1953) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27298] VGAM1953 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1953 was detected is described hereinabove with reference to Figs. 2-8.

[27299] VGAM1953 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM1953 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27300] VGAM1953 gene, herein designated VGAM GENE, encodes a VGAM1953 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1953 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1953 precursor RNA is designated SEQ ID:1939, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1939 is located at position 3760 relative to the genome of Avian paramyxovirus 6.

[27301] VGAM1953 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27302] An enzyme complex designated DICER COMPLEX, dices the VGAM1953 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1953 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1953 RNA is designated SEQ ID:4664, and is provided hereinbelow with reference to the sequence listing part.

[27303] VGAM1953 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1953 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1953 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27304] VGAM1953 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1953 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1953 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1953 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1953 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27305] The complementary binding of VGAM1953 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1953 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1953

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1953 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27306] It is appreciated that VGAM1953 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1953 host target genes. The mRNA of each one of this plurality of VGAM1953 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1953 RNA, herein designated VGAM RNA, and which when bound by VGAM1953 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1953 host target proteins.

[27307] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1953 gene, herein designated VGAM GENE, on one or more VGAM1953 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27308] It is yet further appreciated that a function of VGAM1953 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1953 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1953 correlate with, and may be deduced from, the identity of the host target genes which VGAM1953 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27309] Nucleotide sequences of the VGAM1953 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1953 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1953 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1953 are further described hereinbelow with reference to Table 1.

[27310] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1953 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27311] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1954 (VGAM1954) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27312] VGAM1954 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1954 was detected is described hereinabove with reference to Figs. 2-8.

[27313] VGAM1954 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM1954 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[27314] VGAM1954 gene, herein designated VGAM GENE, encodes a VGAM1954 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1954 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1954 precursor RNA is designated SEQ ID:1940, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1940 is located at position 6741 relative to the genome of Avian paramyxovirus 6.

[27315] VGAM1954 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27316] An enzyme complex designated DICER COMPLEX, dices

the VGAM1954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1954 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1954 RNA is designated SEQ ID:4665, and is provided hereinbelow with reference to the sequence listing part.

[27317] VGAM1954 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27318] VGAM1954 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1954 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1954 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1954 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27319] The complementary binding of VGAM1954 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1954 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27320] It is appreciated that VGAM1954 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1954 host target genes. The mRNA of each one of this plurality of VGAM1954 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1954 RNA, herein designated VGAM RNA, and which when bound by VGAM1954 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1954 host target proteins.

[27321] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1954 gene, herein designated VGAM GENE, on one or more VGAM1954 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27322] It is yet further appreciated that a function of VGAM1954 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1954 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1954 correlate with, and may be deduced from, the identity of the host target genes which VGAM1954 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27323] Nucleotide sequences of the VGAM1954 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1954 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1954 are further described hereinbelow with reference to Table 1.

[27324] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1954 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27325] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1955 (VGAM1955) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27326] VGAM1955 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1955 was detected is described hereinabove with reference to Figs. 2-8.

[27327] VGAM1955 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1955 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27328] VGAM1955 gene, herein designated VGAM GENE, encodes a VGAM1955 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1955 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1955 precursor RNA is designated SEQ ID:1941, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1941 is located at position 6373 relative to the genome of Macaca mulatta rhadinovirus.

[27329] VGAM1955 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27330] An enzyme complex designated DICER COMPLEX, dices the VGAM1955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1955 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1955 RNA is designated SEQ ID:4666, and is provided hereinbelow with reference to the sequence listing part.

[27331] VGAM1955 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1955 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1955 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27332] VGAM1955 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1955 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1955 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1955 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27333] The complementary binding of VGAM1955 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1955 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1955 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1955 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27334] It is appreciated that VGAM1955 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1955 host target genes. The mRNA of each one of this plurality of VGAM1955 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1955 RNA, herein designated VGAM RNA, and which when bound by VGAM1955 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1955 host target proteins.

[27335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1955 gene, herein designated VGAM GENE, on one or more VGAM1955 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27336] It is yet further appreciated that a function of VGAM1955 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1955 correlate with, and may be deduced from, the identity of the host target genes which VGAM1955 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27337] Nucleotide sequences of the VGAM1955 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1955 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1955 are further described hereinbelow with reference to Table 1.

[27338] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1955 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27339] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1956 (VGAM1956) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27340] VGAM1956 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1956 was detected is described hereinabove with reference to Figs. 2-8.

[27341] VGAM1956 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadi-

novirus. VGAM1956 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27342] VGAM1956 gene, herein designated VGAM GENE, encodes a VGAM1956 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1956 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1956 precursor RNA is designated SEQ ID:1942, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1942 is located at position 11662 relative to the genome of Macaca mulatta rhadinovirus.

[27343] VGAM1956 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27344] An enzyme complex designated DICER COMPLEX, dices the VGAM1956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1956 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1956 RNA is designated SEQ ID:4667, and is provided hereinbelow with reference to the sequence listing part.

[27345] VGAM1956 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27346] VGAM1956 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1956 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27347] The complementary binding of VGAM1956 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1956 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27348] It is appreciated that VGAM1956 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1956 host target genes. The mRNA of each one of this plurality of VGAM1956 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1956 RNA, herein designated VGAM RNA, and which when bound by VGAM1956 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1956 host target proteins.

[27349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1956 gene, herein designated VGAM GENE, on one or more VGAM1956 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27350] It is yet further appreciated that a function of VGAM1956 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1956 correlate with, and may be deduced from, the identity of the host target genes which VGAM1956 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27351] Nucleotide sequences of the VGAM1956 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1956 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1956 are further described hereinbelow with reference to Table 1.

[27352] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1956 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27353] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1957 (VGAM1957) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27354] VGAM1957 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1957 was detected is described hereinabove with reference to Figs. 2-8.

[27355] VGAM1957 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1957 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27356] VGAM1957 gene, herein designated VGAM GENE, encodes a VGAM1957 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1957 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1957 precursor RNA is designated SEQ ID:1943, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1943 is located at position 5479 relative to the genome of Macaca mulatta rhadinovirus.

[27357] VGAM1957 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27358] An enzyme complex designated DICER COMPLEX, dices the VGAM1957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1957 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1957 RNA is designated SEQ ID:4668, and is provided hereinbelow with reference to the sequence listing part.

[27359] VGAM1957 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[27360] VGAM1957 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1957 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27361] The complementary binding of VGAM1957 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1957 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27362] It is appreciated that VGAM1957 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1957 host target genes. The mRNA of each one of this plurality of VGAM1957 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1957 RNA, herein designated VGAM RNA, and which when bound by VGAM1957 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1957 host target proteins.

[27363] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1957 gene, herein designated VGAM GENE, on one

or more VGAM1957 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27364] It is yet further appreciated that a function of VGAM1957 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1957 correlate with, and may be deduced from, the identity of the host target genes which VGAM1957 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27365] Nucleotide sequences of the VGAM1957 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1957 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1957 are further described hereinbelow with reference to Table 1.

[27366] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1957 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27367] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1958 (VGAM1958) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27368] VGAM1958 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1958 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[27369] VGAM1958 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1958 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27370] VGAM1958 gene, herein designated VGAM GENE, encodes a VGAM1958 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1958 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1958 precursor RNA is designated SEQ ID:1944, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1944 is located at position 13516 relative to the genome of Macaca mulatta rhadinovirus.

[27371] VGAM1958 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27372] An enzyme complex designated DICER COMPLEX, dices the VGAM1958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1958 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1958 RNA is designated SEQ ID:4669, and is provided hereinbelow with reference to the sequence listing part.

[27373] VGAM1958 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27374] VGAM1958 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1958 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27375] The complementary binding of VGAM1958 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1958 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27376] It is appreciated that VGAM1958 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1958 host target genes. The mRNA of each one of this plurality of VGAM1958 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1958 RNA, herein designated VGAM RNA, and which when bound by VGAM1958 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1958 host target proteins.

[27377] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1958 gene, herein designated VGAM GENE, on one or more VGAM1958 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27378] It is yet further appreciated that a function of VGAM1958 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1958 correlate with, and may be deduced from, the identity of the host target genes which VGAM1958 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27379] Nucleotide sequences of the VGAM1958 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1958 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1958 are further described hereinbelow with reference to Table 1.

[27380] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1958 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27381] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1959 (VGAM1959) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27382] VGAM1959 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1959 was detected is described hereinabove with reference to Figs. 2-8.

[27383] VGAM1959 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1959 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27384] VGAM1959 gene, herein designated VGAM GENE, encodes a VGAM1959 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1959 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1959 precursor RNA is designated SEQ ID:1945, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1945 is located at position 16300 relative to the genome of Macaca mulatta rhadinovirus.

[27385] VGAM1959 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1959 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27386] An enzyme complex designated DICER COMPLEX, dices the VGAM1959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1959 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1959 RNA is designated SEQ ID:4670, and is provided hereinbelow with reference to the sequence listing part.

[27387] VGAM1959 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1959 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1959 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27388] VGAM1959 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1959 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1959 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1959 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27389] The complementary binding of VGAM1959 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1959 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1959 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1959 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27390] It is appreciated that VGAM1959 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1959 host target genes. The mRNA of each one of this plurality of VGAM1959 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1959 RNA, herein designated VGAM RNA, and which when bound by VGAM1959 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1959 host target proteins.

[27391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1959 gene, herein designated VGAM GENE, on one or more VGAM1959 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27392] It is yet further appreciated that a function of VGAM1959 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of

VGAM1959 correlate with, and may be deduced from, the identity of the host target genes which VGAM1959 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27393] Nucleotide sequences of the VGAM1959 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1959 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1959 are further described hereinbelow with reference to Table 1.

[27394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1959 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27395] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1960 (VGAM1960) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[27396] VGAM1960 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1960 was detected is described hereinabove with reference to Figs. 2-8.

[27397] VGAM1960 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1960 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27398] VGAM1960 gene, herein designated VGAM GENE, encodes a VGAM1960 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1960 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1960 precursor RNA is designated SEQ ID:1946, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1946 is located at position 10523 relative to the genome of Macaca mulatta rhadinovirus.

[27399] VGAM1960 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27400] An enzyme complex designated DICER COMPLEX, dices the VGAM1960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1960 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1960 RNA is designated SEQ ID:4671, and is provided hereinbelow with reference to the sequence listing part.

[27401] VGAM1960 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27402] VGAM1960 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1960 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1960 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1960 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27403] The complementary binding of VGAM1960 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1960 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27404] It is appreciated that VGAM1960 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1960 host target genes. The mRNA of each one of this plurality of VGAM1960 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1960 RNA, herein designated VGAM RNA, and which when bound by VGAM1960 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1960 host target proteins.

[27405] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1960 gene, herein designated VGAM GENE, on one or more VGAM1960 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27406] It is yet further appreciated that a function of VGAM1960 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1960 include diagnosis, prevention and

treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM1960 correlate with, and may be deduced from, the identity of the host target genes which VGAM1960 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27407] Nucleotide sequences of the VGAM1960 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1960 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1960 are further described hereinbelow with reference to Table 1.

[27408] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1960 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27409] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1961 (VGAM1961) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27410] VGAM1961 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1961 was detected is described hereinabove with reference to Figs. 2-8.

[27411] VGAM1961 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1961 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27412] VGAM1961 gene, herein designated VGAM GENE, encodes a VGAM1961 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1961 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1961 precursor RNA is designated SEQ ID:1947, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1947 is located at position 16323 relative to the genome of Camelpox virus.

[27413] VGAM1961 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27414] An enzyme complex designated DICER COMPLEX, dices the VGAM1961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1961 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1961 RNA is designated SEQ ID:4672, and is provided hereinbelow with reference to the sequence listing part.

[27415] VGAM1961 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1961 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1961 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27416] VGAM1961 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1961 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1961 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1961 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1961 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27417] The complementary binding of VGAM1961 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1961 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1961 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1961 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27418] It is appreciated that VGAM1961 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1961 host target genes. The mRNA of each one of this plurality of VGAM1961 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1961 RNA, herein designated VGAM

RNA, and which when bound by VGAM1961 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1961 host target proteins.

[27419] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1961 gene, herein designated VGAM GENE, on one or more VGAM1961 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27420] It is yet further appreciated that a function of VGAM1961 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1961 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1961 correlate with, and may be deduced from, the identity of the host target genes which VGAM1961 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27421] Nucleotide sequences of the VGAM1961 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1961 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1961 are further described hereinbelow with reference to Table 1.

[27422] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1961 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27423] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1962 (VGAM1962) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27424] VGAM1962 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1962 was detected is described hereinabove with reference to Figs. 2-8.

[27425] VGAM1962 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1962 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27426] VGAM1962 gene, herein designated VGAM GENE, encodes a VGAM1962 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1962 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1962 precursor RNA is designated SEQ ID:1948, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1948 is located at position

16962 relative to the genome of Camelpox virus.

[27427] VGAM1962 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27428] An enzyme complex designated DICER COMPLEX, dices the VGAM1962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1962 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1962 RNA is designated SEQ ID:4673, and is provided hereinbelow with reference to the sequence listing part.

[27429] VGAM1962 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1962 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1962 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27430] VGAM1962 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1962 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1962 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1962 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1962 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27431] The complementary binding of VGAM1962 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1962 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1962 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1962 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27432] It is appreciated that VGAM1962 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1962 host target genes. The mRNA of each one of this plurality of VGAM1962 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1962 RNA, herein designated VGAM RNA, and which when bound by VGAM1962 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1962 host target proteins.

[27433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1962 gene, herein designated VGAM GENE, on one or more VGAM1962 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27434] It is yet further appreciated that a function of VGAM1962 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1962 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1962 correlate with, and may be deduced from, the identity of the host target genes which VGAM1962 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27435] Nucleotide sequences of the VGAM1962 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1962 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1962 are further described hereinbelow with reference to Table 1.

[27436] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1962 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27437] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1963 (VGAM1963) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27438] VGAM1963 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1963 was detected is described hereinabove with reference to Figs. 2-8.

[27439] VGAM1963 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1963 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27440] VGAM1963 gene, herein designated VGAM GENE, encodes a VGAM1963 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1963 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1963 precursor RNA is designated SEQ ID:1949, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1949 is located at position 17595 relative to the genome of Camelpox virus.

[27441] VGAM1963 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27442] An enzyme complex designated DICER COMPLEX, dices the VGAM1963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1963 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1963 RNA is designated SEQ ID:4674, and is provided hereinbelow with reference to the sequence

listing part.

[27443] VGAM1963 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1963 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1963 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27444] VGAM1963 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1963 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1963 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1963 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1963 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27445] The complementary binding of VGAM1963 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1963 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1963 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1963 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27446] It is appreciated that VGAM1963 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1963 host target genes. The mRNA of each one of this plurality of VGAM1963 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1963 RNA, herein designated VGAM RNA, and which when bound by VGAM1963 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1963 host target proteins.

[27447] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1963 gene, herein designated VGAM GENE, on one or more VGAM1963 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27448] It is yet further appreciated that a function of VGAM1963

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1963 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1963 correlate with, and may be deduced from, the identity of the host target genes which VGAM1963 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27449] Nucleotide sequences of the VGAM1963 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1963 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1963 are further described hereinbelow with reference to Table 1.

[27450] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1963 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27451] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1964 (VGAM1964) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27452] VGAM1964 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1964 was detected is described hereinabove with reference to Figs. 2-8.

[27453] VGAM1964 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1964 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27454] VGAM1964 gene, herein designated VGAM GENE, encodes a VGAM1964 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1964 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1964 precursor RNA is designated SEQ ID:1950, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1950 is located at position 87983 relative to the genome of Rana tigrina ranavirus.

[27455] VGAM1964 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27456] An enzyme complex designated DICER COMPLEX, dices the VGAM1964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1964 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1964 RNA is designated SEQ ID:4675, and

is provided hereinbelow with reference to the sequence listing part.

[27457] VGAM1964 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1964 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1964 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27458] VGAM1964 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1964 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1964 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1964 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1964 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27459] The complementary binding of VGAM1964 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1964 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1964 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1964 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27460] It is appreciated that VGAM1964 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1964 host target genes. The mRNA of each one of this plurality of VGAM1964 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1964 RNA, herein designated VGAM RNA, and which when bound by VGAM1964 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1964 host target proteins.

[27461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1964 gene, herein designated VGAM GENE, on one or more VGAM1964 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27462] It is yet further appreciated that a function of VGAM1964 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1964 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1964 correlate with, and may be deduced from, the identity of the host target genes which VGAM1964 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27463] Nucleotide sequences of the VGAM1964 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1964 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1964 are further described hereinbelow with reference to Table 1.

[27464] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1964 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27465] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1965 (VGAM1965) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27466] VGAM1965 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1965 was detected is described hereinabove with reference to Figs. 2-8.

[27467] VGAM1965 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1965 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27468] VGAM1965 gene, herein designated VGAM GENE, encodes a VGAM1965 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1965 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1965 precur-

sor RNA is designated SEQ ID:1951, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1951 is located at position 100137 relative to the genome of Rana tigrina ranavirus.

[27469] VGAM1965 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27470] An enzyme complex designated DICER COMPLEX, dices the VGAM1965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1965 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM1965 RNA is designated SEQ ID:4676, and is provided hereinbelow with reference to the sequence listing part.

[27471] VGAM1965 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1965 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1965 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27472] VGAM1965 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1965 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1965 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1965 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1965 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27473] The complementary binding of VGAM1965 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1965 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1965 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1965 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27474] It is appreciated that VGAM1965 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1965 host target genes. The mRNA of

each one of this plurality of VGAM1965 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1965 RNA, herein designated VGAM RNA, and which when bound by VGAM1965 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1965 host target proteins.

[27475] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1965 gene, herein designated VGAM GENE, on one or more VGAM1965 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[27476] It is yet further appreciated that a function of VGAM1965 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1965 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1965 correlate with, and may be deduced from, the identity of the host target genes which VGAM1965 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27477] Nucleotide sequences of the VGAM1965 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1965 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1965 are further described hereinbelow with reference to Table 1.

[27478] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1965 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[27479] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1966 (VGAM1966) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27480] VGAM1966 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1966 was detected is described hereinabove with reference to Figs. 2-8.

[27481] VGAM1966 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1966 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27482] VGAM1966 gene, herein designated VGAM GENE, encodes a VGAM1966 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1966 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1966 precursor RNA is designated SEQ ID:1952, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1952 is located at position 88719 relative to the genome of Rana tigrina ranavirus.

[27483] VGAM1966 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27484] An enzyme complex designated DICER COMPLEX, dices the VGAM1966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1966 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1966 RNA is designated SEQ ID:4677, and is provided hereinbelow with reference to the sequence listing part.

[27485] VGAM1966 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1966 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1966 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27486] VGAM1966 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1966 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1966 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1966 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1966 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27487] The complementary binding of VGAM1966 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1966 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1966 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1966 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27488] It is appreciated that VGAM1966 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1966 host target genes. The mRNA of each one of this plurality of VGAM1966 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1966 RNA, herein designated VGAM RNA, and which when bound by VGAM1966 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1966 host target proteins.

[27489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1966 gene, herein designated VGAM GENE, on one or more VGAM1966 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27490] It is yet further appreciated that a function of VGAM1966 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1966 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1966 correlate with, and may be deduced from, the identity of the host target genes which VGAM1966 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27491] Nucleotide sequences of the VGAM1966 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1966 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1966 are further described hereinbelow with reference to Table 1.

[27492] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1966 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27493] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1967 (VGAM1967) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27494] VGAM1967 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1967 was detected is described hereinabove with reference to Figs. 2-8.

[27495] VGAM1967 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1967 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27496] VGAM1967 gene, herein designated VGAM GENE, encodes a VGAM1967 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1967 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1967 precursor RNA is designated SEQ ID:1953, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1953 is located at position 96311 relative to the genome of Rana tigrina ranavirus.

[27497] VGAM1967 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27498] An enzyme complex designated DICER COMPLEX, dices the VGAM1967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1967 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1967 RNA is designated SEQ ID:4678, and is provided hereinbelow with reference to the sequence listing part.

[27499] VGAM1967 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1967 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1967 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27500] VGAM1967 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1967 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1967 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1967 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1967 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27501] The complementary binding of VGAM1967 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1967 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1967 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1967 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27502] It is appreciated that VGAM1967 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1967 host target genes. The mRNA of each one of this plurality of VGAM1967 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1967 RNA, herein designated VGAM RNA, and which when bound by VGAM1967 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1967 host target proteins.

[27503] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1967 gene, herein designated VGAM GENE, on one or more VGAM1967 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27504] It is yet further appreciated that a function of VGAM1967 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1967 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1967 correlate with, and may be deduced from, the identity of the host target genes which VGAM1967 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27505] Nucleotide sequences of the VGAM1967 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1967 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1967 are further described hereinbelow with reference to Table 1.

[27506] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1967 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27507] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1968 (VGAM1968) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27508] VGAM1968 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1968 was detected is described hereinabove with reference to Figs. 2-8.

[27509] VGAM1968 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1968 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27510] VGAM1968 gene, herein designated VGAM GENE, encodes a VGAM1968 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1968 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1968 precursor RNA is designated SEQ ID:1954, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1954 is located at position 97726 relative to the genome of Rana tigrina ranavirus.

[27511] VGAM1968 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27512] An enzyme complex designated DICER COMPLEX, dices the VGAM1968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1968 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1968 RNA is designated SEQ ID:4679, and is provided hereinbelow with reference to the sequence listing part.

[27513] VGAM1968 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1968 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1968 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27514] VGAM1968 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1968 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1968 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1968 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1968 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27515] The complementary binding of VGAM1968 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1968 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1968 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1968 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27516] It is appreciated that VGAM1968 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1968 host target genes. The mRNA of each one of this plurality of VGAM1968 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1968 RNA, herein designated VGAM RNA, and which when bound by VGAM1968 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1968 host target proteins.

[27517] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1968 gene, herein designated VGAM GENE, on one or more VGAM1968 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27518] It is yet further appreciated that a function of VGAM1968 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1968 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1968 correlate with, and may be deduced from, the identity of the host target genes which VGAM1968 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27519] Nucleotide sequences of the VGAM1968 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1968 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1968 are further described hereinbelow with reference to Table 1.

[27520] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1968 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27521] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1969 (VGAM1969) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27522] VGAM1969 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1969 was detected is described hereinabove with reference to Figs. 2-8.

[27523] VGAM1969 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1969 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27524] VGAM1969 gene, herein designated VGAM GENE, encodes a VGAM1969 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1969 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1969 precursor RNA is designated SEQ ID:1955, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1955 is located at position 88273 relative to the genome of Rana tigrina ranavirus.

[27525] VGAM1969 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27526] An enzyme complex designated DICER COMPLEX, dices the VGAM1969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1969 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1969 RNA is designated SEQ ID:4680, and is provided hereinbelow with reference to the sequence listing part.

[27527] VGAM1969 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1969 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1969 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27528] VGAM1969 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1969 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1969 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1969 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1969 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27529] The complementary binding of VGAM1969 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1969 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1969 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1969 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[27530] It is appreciated that VGAM1969 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1969 host target genes. The mRNA of each one of this plurality of VGAM1969 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1969 RNA, herein designated VGAM RNA, and which when bound by VGAM1969 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1969 host target proteins.

[27531] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1969 gene, herein designated VGAM GENE, on one or more VGAM1969 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27532] It is yet further appreciated that a function of VGAM1969 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1969 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1969 correlate with, and may be deduced from, the identity of the host target genes which VGAM1969 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27533] Nucleotide sequences of the VGAM1969 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1969 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1969 are further described hereinbelow with reference to Table 1.

[27534] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1969 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27535] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1970 (VGAM1970) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27536] VGAM1970 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1970 was detected is described hereinabove with reference to Figs. 2-8.

[27537] VGAM1970 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1970 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27538] VGAM1970 gene, herein designated VGAM GENE, encodes a VGAM1970 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1970 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1970 precur-

sor RNA is designated SEQ ID:1956, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1956 is located at position 98318 relative to the genome of Rana tigrina ranavirus.

[27539] VGAM1970 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27540] An enzyme complex designated DICER COMPLEX, dices the VGAM1970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1970 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide se-

quence of VGAM1970 RNA is designated SEQ ID:4681, and is provided hereinbelow with reference to the sequence listing part.

[27541] VGAM1970 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1970 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1970 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27542] VGAM1970 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1970 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1970 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1970 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1970 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27543] The complementary binding of VGAM1970 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1970 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1970 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1970 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27544] It is appreciated that VGAM1970 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1970 host target genes. The mRNA of

each one of this plurality of VGAM1970 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1970 RNA, herein designated VGAM RNA, and which when bound by VGAM1970 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1970 host target proteins.

[27545] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1970 gene, herein designated VGAM GENE, on one or more VGAM1970 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[27546] It is yet further appreciated that a function of VGAM1970 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1970 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1970 correlate with, and may be deduced from, the identity of the host target genes which VGAM1970 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27547] Nucleotide sequences of the VGAM1970 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1970 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1970 are further described hereinbelow with reference to Table 1.

[27548] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1970 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[27549] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1971 (VGAM1971) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27550] VGAM1971 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1971 was detected is described hereinabove with reference to Figs. 2-8.

[27551] VGAM1971 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1971 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27552] VGAM1971 gene, herein designated VGAM GENE, encodes a VGAM1971 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1971 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1971 precursor RNA is designated SEQ ID:1957, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1957 is located at position 90823 relative to the genome of Rana tigrina ranavirus.

[27553] VGAM1971 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27554] An enzyme complex designated DICER COMPLEX, dices the VGAM1971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1971 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1971 RNA is designated SEQ ID:4682, and is provided hereinbelow with reference to the sequence listing part.

[27555] VGAM1971 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1971 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1971 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27556] VGAM1971 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1971 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1971 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1971 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1971 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27557] The complementary binding of VGAM1971 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1971 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1971 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1971 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27558] It is appreciated that VGAM1971 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1971 host target genes. The mRNA of each one of this plurality of VGAM1971 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1971 RNA, herein designated VGAM RNA, and which when bound by VGAM1971 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1971 host target proteins.

[27559] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1971 gene, herein designated VGAM GENE, on one or more VGAM1971 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27560] It is yet further appreciated that a function of VGAM1971 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1971 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM1971 correlate with, and may be deduced from, the identity of the host target genes which VGAM1971 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27561] Nucleotide sequences of the VGAM1971 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1971 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1971 are further described hereinbelow with reference to Table 1.

[27562] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1971 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27563] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1972 (VGAM1972) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27564] VGAM1972 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1972 was detected is described hereinabove with reference to Figs. 2-8.

[27565] VGAM1972 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1972 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27566] VGAM1972 gene, herein designated VGAM GENE, encodes a VGAM1972 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1972 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1972 precursor RNA is designated SEQ ID:1958, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1958 is located at position 10062 relative to the genome of Bovine herpesvirus 4.

[27567] VGAM1972 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27568] An enzyme complex designated DICER COMPLEX, dices the VGAM1972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1972 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1972 RNA is designated SEQ ID:4683, and is provided hereinbelow with reference to the sequence listing part.

[27569] VGAM1972 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1972 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1972 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27570] VGAM1972 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1972 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1972 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1972 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1972 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27571] The complementary binding of VGAM1972 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1972 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1972 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1972 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27572] It is appreciated that VGAM1972 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1972 host target genes. The mRNA of each one of this plurality of VGAM1972 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1972 RNA, herein designated VGAM RNA, and which when bound by VGAM1972 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1972 host target proteins.

[27573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1972 gene, herein designated VGAM GENE, on one or more VGAM1972 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27574] It is yet further appreciated that a function of VGAM1972 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1972 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1972 correlate with, and may be deduced from, the identity of the host target genes which VGAM1972 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27575] Nucleotide sequences of the VGAM1972 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1972 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1972 are further described hereinbelow with reference to Table 1.

[27576] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1972 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27577] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1973 (VGAM1973) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27578] VGAM1973 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1973 was detected is described hereinabove with reference to Figs. 2-8.

[27579] VGAM1973 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1973 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27580] VGAM1973 gene, herein designated VGAM GENE, encodes a VGAM1973 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1973 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1973 precursor RNA is designated SEQ ID:1959, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1959 is located at position 5233 relative to the genome of Bovine herpesvirus 4.

[27581] VGAM1973 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27582] An enzyme complex designated DICER COMPLEX, dices the VGAM1973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1973 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1973 RNA is designated SEQ ID:4684, and is provided hereinbelow with reference to the sequence listing part.

[27583] VGAM1973 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1973 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1973 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27584] VGAM1973 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1973 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1973 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1973 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1973 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27585] The complementary binding of VGAM1973 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1973 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1973 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1973 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27586] It is appreciated that VGAM1973 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1973 host target genes. The mRNA of each one of this plurality of VGAM1973 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1973 RNA, herein designated VGAM RNA, and which when bound by VGAM1973 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1973 host target proteins.

[27587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1973 gene, herein designated VGAM GENE, on one or more VGAM1973 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27588] It is yet further appreciated that a function of VGAM1973 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1973 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1973 correlate with, and may be deduced from, the identity of the host target genes which VGAM1973 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27589] Nucleotide sequences of the VGAM1973 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1973 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1973 are further described hereinbelow with reference to Table 1.

[27590] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1973 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27591] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1974 (VGAM1974) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27592] VGAM1974 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1974 was detected is described hereinabove with reference to Figs. 2-8.

[27593] VGAM1974 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1974 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27594] VGAM1974 gene, herein designated VGAM GENE, encodes a VGAM1974 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1974 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1974 precursor RNA is designated SEQ ID:1960, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1960 is located at position 14078 relative to the genome of Bovine herpesvirus 4.

[27595] VGAM1974 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27596] An enzyme complex designated DICER COMPLEX, dices the VGAM1974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1974 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1974 RNA is designated SEQ ID:4685, and is provided hereinbelow with reference to the sequence listing part.

[27597] VGAM1974 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1974 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1974 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27598] VGAM1974 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1974 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1974 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1974 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1974 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27599] The complementary binding of VGAM1974 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1974 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1974 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1974 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[27600] It is appreciated that VGAM1974 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1974 host target genes. The mRNA of each one of this plurality of VGAM1974 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1974 RNA, herein designated VGAM RNA, and which when bound by VGAM1974 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1974 host target proteins.

[27601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1974 gene, herein designated VGAM GENE, on one or more VGAM1974 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27602] It is yet further appreciated that a function of VGAM1974 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1974 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1974 correlate with, and may be deduced from, the identity of the host target genes which VGAM1974 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27603] Nucleotide sequences of the VGAM1974 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1974 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1974 are further described hereinbelow with reference to Table 1.

[27604] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1974 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27605] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1975 (VGAM1975) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27606] VGAM1975 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1975 was detected is described hereinabove with reference to Figs. 2-8.

[27607] VGAM1975 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1975 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27608] VGAM1975 gene, herein designated VGAM GENE, encodes a VGAM1975 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1975 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1975 precursor RNA is designated SEQ ID:1961, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1961 is located at position 9804 relative to the genome of Bovine herpesvirus 4.

[27609] VGAM1975 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27610] An enzyme complex designated DICER COMPLEX, dices the VGAM1975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1975 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1975 RNA is designated SEQ ID:4686, and is provided hereinbelow with reference to the sequence listing part.

[27611] VGAM1975 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1975 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1975 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27612] VGAM1975 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1975 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1975 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1975 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1975 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27613] The complementary binding of VGAM1975 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1975 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1975 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1975 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27614] It is appreciated that VGAM1975 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1975 host target genes. The mRNA of each one of this plurality of VGAM1975 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1975 RNA, herein designated VGAM RNA, and which when bound by VGAM1975 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1975 host target proteins.

[27615] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1975 gene, herein designated VGAM GENE, on one or more VGAM1975 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27616] It is yet further appreciated that a function of VGAM1975 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1975 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1975 correlate with, and may be deduced from, the identity of the host target genes which VGAM1975 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27617] Nucleotide sequences of the VGAM1975 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1975 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1975 are further described hereinbelow with reference to Table 1.

[27618] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1975 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27619] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1976 (VGAM1976) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27620] VGAM1976 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1976 was detected is described hereinabove with reference to Figs. 2-8.

[27621] VGAM1976 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1976 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27622] VGAM1976 gene, herein designated VGAM GENE, encodes

a VGAM1976 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1976 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1976 precursor RNA is designated SEQ ID:1962, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1962 is located at position 13694 relative to the genome of Bovine herpesvirus 4.

[27623] VGAM1976 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27624] An enzyme complex designated DICER COMPLEX, dices the VGAM1976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1976 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1976 RNA is designated SEQ ID:4687, and is provided hereinbelow with reference to the sequence listing part.

[27625] VGAM1976 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1976 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1976 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27626] VGAM1976 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1976 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1976 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1976 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1976 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27627] The complementary binding of VGAM1976 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1976 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1976 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1976 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27628] It is appreciated that VGAM1976 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1976 host target genes. The mRNA of each one of this plurality of VGAM1976 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1976 RNA, herein designated VGAM RNA, and which when bound by VGAM1976 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1976 host target proteins.

[27629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1976 gene, herein designated VGAM GENE, on one or more VGAM1976 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27630] It is yet further appreciated that a function of VGAM1976 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1976 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1976 correlate with, and may be deduced from, the identity of the host target genes which VGAM1976 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27631] Nucleotide sequences of the VGAM1976 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1976 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1976 are further

described hereinbelow with reference to Table 1.

[27632] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1976 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27633] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1977 (VGAM1977) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27634] VGAM1977 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1977 was detected is described hereinabove with reference to Figs. 2-8.

[27635] VGAM1977 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1977 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27636] VGAM1977 gene, herein designated VGAM GENE, encodes a VGAM1977 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1977 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1977 precursor RNA is designated SEQ ID:1963, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1963 is located at position 5340 relative to the genome of Bovine herpesvirus 4.

[27637] VGAM1977 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27638] An enzyme complex designated DICER COMPLEX, dices the VGAM1977 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1977 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1977 RNA is designated SEQ ID:4688, and is provided hereinbelow with reference to the sequence listing part.

[27639] VGAM1977 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1977 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1977 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27640] VGAM1977 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1977 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1977 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1977 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1977 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27641] The complementary binding of VGAM1977 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1977 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1977

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1977 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27642] It is appreciated that VGAM1977 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1977 host target genes. The mRNA of each one of this plurality of VGAM1977 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1977 RNA, herein designated VGAM RNA, and which when bound by VGAM1977 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1977 host target proteins.

[27643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1977 gene, herein designated VGAM GENE, on one or more VGAM1977 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27644] It is yet further appreciated that a function of VGAM1977 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1977 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1977 correlate with, and may be deduced from, the identity of the host target genes which VGAM1977 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27645] Nucleotide sequences of the VGAM1977 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1977 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1977 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1977 are further described hereinbelow with reference to Table 1.

[27646] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1977 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27647] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1978 (VGAM1978) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27648] VGAM1978 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1978 was detected is described hereinabove with reference to Figs. 2-8.

[27649] VGAM1978 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1978 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[27650] VGAM1978 gene, herein designated VGAM GENE, encodes a VGAM1978 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1978 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1978 precursor RNA is designated SEQ ID:1964, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1964 is located at position 2128 relative to the genome of Bovine herpesvirus 4.

[27651] VGAM1978 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27652] An enzyme complex designated DICER COMPLEX, dices

the VGAM1978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1978 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1978 RNA is designated SEQ ID:4689, and is provided hereinbelow with reference to the sequence listing part.

[27653] VGAM1978 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1978 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1978 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27654] VGAM1978 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1978 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1978 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1978 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1978 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27655] The complementary binding of VGAM1978 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1978 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1978 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1978 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27656] It is appreciated that VGAM1978 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1978 host target genes. The mRNA of each one of this plurality of VGAM1978 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1978 RNA, herein designated VGAM RNA, and which when bound by VGAM1978 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1978 host target proteins.

[27657] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1978 gene, herein designated VGAM GENE, on one or more VGAM1978 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27658] It is yet further appreciated that a function of VGAM1978 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1978 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1978 correlate with, and may be deduced from, the identity of the host target genes which VGAM1978 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27659] Nucleotide sequences of the VGAM1978 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1978 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1978 are further described hereinbelow with reference to Table 1.

[27660] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1978 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27661] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1979 (VGAM1979) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27662] VGAM1979 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1979 was detected is described hereinabove with reference to Figs. 2-8.

[27663] VGAM1979 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1979 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[27664] VGAM1979 gene, herein designated VGAM GENE, encodes a VGAM1979 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1979 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1979 precursor RNA is designated SEQ ID:1965, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1965 is located at position 11708 relative to the genome of Bovine herpesvirus 4.

[27665] VGAM1979 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27666] An enzyme complex designated DICER COMPLEX, dices the VGAM1979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1979 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1979 RNA is designated SEQ ID:4690, and is provided hereinbelow with reference to the sequence listing part.

[27667] VGAM1979 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1979 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1979 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27668] VGAM1979 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1979 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1979 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1979 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1979 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27669] The complementary binding of VGAM1979 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1979 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1979 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1979 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27670] It is appreciated that VGAM1979 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1979 host target genes. The mRNA of each one of this plurality of VGAM1979 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1979 RNA, herein designated VGAM RNA, and which when bound by VGAM1979 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1979 host target proteins.

[27671] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1979 gene, herein designated VGAM GENE, on one or more VGAM1979 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27672] It is yet further appreciated that a function of VGAM1979 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1979 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1979 correlate with, and may be deduced from, the identity of the host target genes which VGAM1979 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27673] Nucleotide sequences of the VGAM1979 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1979 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1979 are further described hereinbelow with reference to Table 1.

[27674] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1979 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27675] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1980 (VGAM1980) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27676] VGAM1980 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1980 was detected is described hereinabove with reference to Figs. 2-8.

[27677] VGAM1980 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4.

VGAM1980 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27678] VGAM1980 gene, herein designated VGAM GENE, encodes a VGAM1980 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1980 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1980 precursor RNA is designated SEQ ID:1966, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1966 is located at position 9455 relative to the genome of Bovine herpesvirus 4.

[27679] VGAM1980 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[27680] An enzyme complex designated DICER COMPLEX, dices the VGAM1980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1980 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1980 RNA is designated SEQ ID:4691, and is provided hereinbelow with reference to the sequence listing part.

[27681] VGAM1980 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1980 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1980 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27682] VGAM1980 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1980 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1980 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1980 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1980 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27683] The complementary binding of VGAM1980 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1980 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1980 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1980 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27684] It is appreciated that VGAM1980 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1980 host target genes. The mRNA of each one of this plurality of VGAM1980 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1980 RNA, herein designated VGAM RNA, and which when bound by VGAM1980 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1980 host target proteins.

[27685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1980 gene, herein designated VGAM GENE, on one or more VGAM1980 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27686] It is yet further appreciated that a function of VGAM1980 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1980 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1980 correlate with, and may be deduced from, the identity of the host target genes which VGAM1980 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27687] Nucleotide sequences of the VGAM1980 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1980 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1980 are further described hereinbelow with reference to Table 1.

[27688] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1980 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27689] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1981 (VGAM1981) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27690] VGAM1981 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1981 was detected is described hereinabove with reference to Figs. 2-8.

[27691] VGAM1981 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Hendra virus. VGAM1981 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27692] VGAM1981 gene, herein designated VGAM GENE, encodes a VGAM1981 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1981 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1981 precursor RNA is designated SEQ ID:1967, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1967 is located at position 10871 relative to the genome of Hendra virus.

[27693] VGAM1981 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27694] An enzyme complex designated DICER COMPLEX, dices the VGAM1981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1981 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1981 RNA is designated SEQ ID:4692, and is provided hereinbelow with reference to the sequence listing part.

[27695] VGAM1981 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1981 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1981 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27696] VGAM1981 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1981 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1981 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1981 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1981 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27697] The complementary binding of VGAM1981 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1981 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1981 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1981 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27698] It is appreciated that VGAM1981 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1981 host target genes. The mRNA of each one of this plurality of VGAM1981 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1981 RNA, herein designated VGAM RNA, and which when bound by VGAM1981 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1981 host target proteins.

[27699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1981 gene, herein designated VGAM GENE, on one or more VGAM1981 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27700] It is yet further appreciated that a function of VGAM1981 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1981 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM1981 correlate with, and may be deduced from, the identity of the host target genes which VGAM1981 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27701] Nucleotide sequences of the VGAM1981 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1981 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1981 are further described hereinbelow with reference to Table 1.

[27702] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1981 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27703] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1982 (VGAM1982) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27704] VGAM1982 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1982 was detected is described hereinabove with reference to Figs. 2-8.

[27705] VGAM1982 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus.

VGAM1982 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27706] VGAM1982 gene, herein designated VGAM GENE, encodes a VGAM1982 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1982 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1982 precursor RNA is designated SEQ ID:1968, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1968 is located at position 3780 relative to the genome of Hendra virus.

[27707] VGAM1982 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1982 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27708] An enzyme complex designated DICER COMPLEX, dices the VGAM1982 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1982 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1982 RNA is designated SEQ ID:4693, and is provided hereinbelow with reference to the sequence listing part.

[27709] VGAM1982 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1982 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1982 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[27710] VGAM1982 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1982 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1982 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1982 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1982 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27711] The complementary binding of VGAM1982 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1982 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1982 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1982 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27712] It is appreciated that VGAM1982 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1982 host target genes. The mRNA of each one of this plurality of VGAM1982 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1982 RNA, herein designated VGAM RNA, and which when bound by VGAM1982 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1982 host target proteins.

[27713] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1982 gene, herein designated VGAM GENE, on one

or more VGAM1982 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27714] It is yet further appreciated that a function of VGAM1982 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1982 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM1982 correlate with, and may be deduced from, the identity of the host target genes which VGAM1982 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27715] Nucleotide sequences of the VGAM1982 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1982 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1982 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1982 are further described hereinbelow with reference to Table 1.

[27716] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1982 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27717] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1983 (VGAM1983) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27718] VGAM1983 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1983 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[27719] VGAM1983 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus.
VGAM1983 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27720] VGAM1983 gene, herein designated VGAM GENE, encodes a VGAM1983 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1983 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1983 precursor RNA is designated SEQ ID:1969, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1969 is located at position 5639 relative to the genome of Hendra virus.

[27721] VGAM1983 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27722] An enzyme complex designated DICER COMPLEX, dices the VGAM1983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1983 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1983 RNA is designated SEQ ID:4694, and is provided hereinbelow with reference to the sequence listing part.

[27723] VGAM1983 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1983 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1983 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27724] VGAM1983 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1983 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1983 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1983 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1983 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[27725] The complementary binding of VGAM1983 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1983 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1983 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1983 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27726] It is appreciated that VGAM1983 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1983 host target genes. The mRNA of each one of this plurality of VGAM1983 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1983 RNA, herein designated VGAM RNA, and which when bound by VGAM1983 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1983 host target proteins.

[27727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1983 gene, herein designated VGAM GENE, on one or more VGAM1983 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27728] It is yet further appreciated that a function of VGAM1983 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1983 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM1983 correlate with, and may be deduced from, the identity of the host target genes which VGAM1983 binds and inhibits, and the function of these host target genes, as elaborated herein-

below.

[27729] Nucleotide sequences of the VGAM1983 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1983 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1983 are further described hereinbelow with reference to Table 1.

[27730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1983 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27731] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1984 (VGAM1984) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27732] VGAM1984 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1984 was detected is described hereinabove with reference to Figs. 2-8.

[27733] VGAM1984 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus.

VGAM1984 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27734] VGAM1984 gene, herein designated VGAM GENE, encodes a VGAM1984 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1984 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1984 precursor RNA is designated SEQ ID:1970, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1970 is located at position 7867 relative to the genome of Hendra virus.

[27735] VGAM1984 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27736] An enzyme complex designated DICER COMPLEX, dices the VGAM1984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1984 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1984 RNA is designated SEQ ID:4695, and is provided hereinbelow with reference to the sequence listing part.

[27737] VGAM1984 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1984 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1984 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27738] VGAM1984 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1984 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1984 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1984 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1984 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27739] The complementary binding of VGAM1984 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1984 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1984 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1984 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27740] It is appreciated that VGAM1984 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1984 host target genes. The mRNA of each one of this plurality of VGAM1984 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1984 RNA, herein designated VGAM RNA, and which when bound by VGAM1984 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1984 host target proteins.

[27741] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1984 gene, herein designated VGAM GENE, on one or more VGAM1984 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27742] It is yet further appreciated that a function of VGAM1984 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1984 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM1984 correlate with, and may be deduced from, the identity of the host target genes which VGAM1984 binds and inhibits, and the

function of these host target genes, as elaborated herein-below.

[27743] Nucleotide sequences of the VGAM1984 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1984 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1984 are further described hereinbelow with reference to Table 1.

[27744] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1984 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27745] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1985 (VGAM1985) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27746] VGAM1985 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1985 was detected is described hereinabove with reference to Figs. 2-8.

[27747] VGAM1985 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus. VGAM1985 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27748] VGAM1985 gene, herein designated VGAM GENE, encodes a VGAM1985 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1985 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1985 precursor RNA is designated SEQ ID:1971, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1971 is located at position 3920 relative to the genome of Hendra virus.

[27749] VGAM1985 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27750] An enzyme complex designated DICER COMPLEX, dices the VGAM1985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1985 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1985 RNA is designated SEQ ID:4696, and is provided hereinbelow with reference to the sequence listing part.

[27751] VGAM1985 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1985 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1985 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27752] VGAM1985 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1985 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1985 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1985 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1985 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27753] The complementary binding of VGAM1985 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1985 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1985 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1985 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27754] It is appreciated that VGAM1985 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1985 host target genes. The mRNA of each one of this plurality of VGAM1985 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1985 RNA, herein designated VGAM RNA, and which when bound by VGAM1985 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1985 host target proteins.

[27755] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1985 gene, herein designated VGAM GENE, on one or more VGAM1985 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27756] It is yet further appreciated that a function of VGAM1985 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1985 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM1985 correlate with, and may be deduced from, the identity of the host

target genes which VGAM1985 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[27757] Nucleotide sequences of the VGAM1985 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1985 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1985 are further described hereinbelow with reference to Table 1.

[27758] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1985 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27759] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1986 (VGAM1986) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27760] VGAM1986 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1986 was detected is described hereinabove with reference to Figs. 2-8.

[27761] VGAM1986 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus. VGAM1986 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27762] VGAM1986 gene, herein designated VGAM GENE, encodes a VGAM1986 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1986 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1986 precursor RNA is designated SEQ ID:1972, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1972 is located at position 4500 relative to the genome of Hendra virus.

[27763] VGAM1986 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1986 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27764] An enzyme complex designated DICER COMPLEX, dices the VGAM1986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1986 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1986 RNA is designated SEQ ID:4697, and is provided hereinbelow with reference to the sequence listing part.

[27765] VGAM1986 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1986 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1986 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27766] VGAM1986 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1986 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1986 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1986 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1986 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27767] The complementary binding of VGAM1986 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1986 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1986 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1986 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27768] It is appreciated that VGAM1986 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1986 host target genes. The mRNA of each one of this plurality of VGAM1986 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1986 RNA, herein designated VGAM RNA, and which when bound by VGAM1986 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1986 host target proteins.

[27769] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1986 gene, herein designated VGAM GENE, on one or more VGAM1986 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27770] It is yet further appreciated that a function of VGAM1986 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1986 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM1986 correlate

with, and may be deduced from, the identity of the host target genes which VGAM1986 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27771] Nucleotide sequences of the VGAM1986 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1986 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1986 are further described hereinbelow with reference to Table 1.

[27772] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1986 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27773] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1987 (VGAM1987) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[27774] VGAM1987 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1987 was detected is described hereinabove with reference to Figs. 2-8.

[27775] VGAM1987 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus.
VGAM1987 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27776] VGAM1987 gene, herein designated VGAM GENE, encodes a VGAM1987 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1987 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1987 precursor RNA is designated SEQ ID:1973, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1973 is located at position 11388 relative to the genome of Hendra virus.

[27777] VGAM1987 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1987 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27778] An enzyme complex designated DICER COMPLEX, dices the VGAM1987 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1987 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1987 RNA is designated SEQ ID:4698, and is provided hereinbelow with reference to the sequence listing part.

[27779] VGAM1987 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1987 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1987 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27780] VGAM1987 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1987 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1987 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1987 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1987 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27781] The complementary binding of VGAM1987 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1987 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1987 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1987 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27782] It is appreciated that VGAM1987 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1987 host target genes. The mRNA of each one of this plurality of VGAM1987 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1987 RNA, herein designated VGAM RNA, and which when bound by VGAM1987 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1987 host target proteins.

[27783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1987 gene, herein designated VGAM GENE, on one or more VGAM1987 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27784] It is yet further appreciated that a function of VGAM1987 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1987 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific func-

tions, and accordingly utilities, of VGAM1987 correlate with, and may be deduced from, the identity of the host target genes which VGAM1987 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27785] Nucleotide sequences of the VGAM1987 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1987 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1987 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1987 are further described hereinbelow with reference to Table 1.

[27786] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1987 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27787] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1988 (VGAM1988) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[27788] VGAM1988 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1988 was detected is described hereinabove with reference to Figs. 2-8.

[27789] VGAM1988 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus.
VGAM1988 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27790] VGAM1988 gene, herein designated VGAM GENE, encodes a VGAM1988 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1988 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1988 precursor RNA is designated SEQ ID:1974, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1974 is located at position 15383 relative to the genome of Hendra virus.

[27791] VGAM1988 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27792] An enzyme complex designated DICER COMPLEX, dices the VGAM1988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1988 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1988 RNA is designated SEQ ID:4699, and is provided hereinbelow with reference to the sequence listing part.

[27793] VGAM1988 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1988 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1988 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27794] VGAM1988 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1988 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1988 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1988 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1988 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27795] The complementary binding of VGAM1988 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1988 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1988 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1988 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27796] It is appreciated that VGAM1988 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1988 host target genes. The mRNA of each one of this plurality of VGAM1988 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1988 RNA, herein designated VGAM RNA, and which when bound by VGAM1988 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1988 host target proteins.

[27797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1988 gene, herein designated VGAM GENE, on one or more VGAM1988 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27798] It is yet further appreciated that a function of VGAM1988 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1988 include diagnosis, prevention and

treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM1988 correlate with, and may be deduced from, the identity of the host target genes which VGAM1988 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27799] Nucleotide sequences of the VGAM1988 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1988 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1988 are further described hereinbelow with reference to Table 1.

[27800] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1988 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27801] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1989 (VGAM1989) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27802] VGAM1989 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1989 was detected is described hereinabove with reference to Figs. 2-8.

[27803] VGAM1989 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus. VGAM1989 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27804] VGAM1989 gene, herein designated VGAM GENE, encodes a VGAM1989 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1989 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1989 precursor RNA is designated SEQ ID:1975, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1975 is located at position 1467 relative to the genome of Hendra virus.

[27805] VGAM1989 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27806] An enzyme complex designated DICER COMPLEX, dices the VGAM1989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1989 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1989 RNA is designated SEQ ID:4700, and is provided hereinbelow with reference to the sequence listing part.

[27807] VGAM1989 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1989 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1989 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27808] VGAM1989 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1989 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1989 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1989 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1989 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27809] The complementary binding of VGAM1989 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1989 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1989 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1989 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27810] It is appreciated that VGAM1989 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1989 host target genes. The mRNA of each one of this plurality of VGAM1989 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1989 RNA, herein designated VGAM

RNA, and which when bound by VGAM1989 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1989 host target proteins.

[27811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1989 gene, herein designated VGAM GENE, on one or more VGAM1989 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27812] It is yet further appreciated that a function of VGAM1989 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1989 include diagnosis, prevention and treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM1989 correlate with, and may be deduced from, the identity of the host target genes which VGAM1989 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27813] Nucleotide sequences of the VGAM1989 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1989 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1989 are further described hereinbelow with reference to Table 1.

[27814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1989 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27815] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1990 (VGAM1990) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27816] VGAM1990 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1990 was detected is described hereinabove with reference to Figs. 2-8.

[27817] VGAM1990 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1990 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27818] VGAM1990 gene, herein designated VGAM GENE, encodes a VGAM1990 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1990 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1990 precursor RNA is designated SEQ ID:1976, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1976 is located at position 7327 relative to the genome of Nipah virus.

[27819] VGAM1990 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27820] An enzyme complex designated DICER COMPLEX, dices the VGAM1990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1990 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1990 RNA is designated SEQ ID:4701, and is provided hereinbelow with reference to the sequence listing part.

[27821] VGAM1990 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1990 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1990 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27822] VGAM1990 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1990 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1990 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1990 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1990 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27823] The complementary binding of VGAM1990 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1990 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1990 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1990 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27824] It is appreciated that VGAM1990 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1990 host target genes. The mRNA of each one of this plurality of VGAM1990 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1990 RNA, herein designated VGAM

RNA, and which when bound by VGAM1990 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1990 host target proteins.

[27825] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1990 gene, herein designated VGAM GENE, on one or more VGAM1990 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27826] It is yet further appreciated that a function of VGAM1990 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1990 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1990 correlate with, and may be deduced from, the identity of the host target genes which VGAM1990 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27827] Nucleotide sequences of the VGAM1990 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1990 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1990 are further described hereinbelow with reference to Table 1.

[27828] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1990 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27829] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1991 (VGAM1991) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27830] VGAM1991 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1991 was detected is described hereinabove with reference to Figs. 2-8.

[27831] VGAM1991 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1991 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27832] VGAM1991 gene, herein designated VGAM GENE, encodes a VGAM1991 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1991 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1991 precursor RNA is designated SEQ ID:1977, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1977 is located at position 2776 relative to the genome of Nipah virus.

[27833] VGAM1991 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27834] An enzyme complex designated DICER COMPLEX, dices the VGAM1991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1991 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1991 RNA is designated SEQ ID:4702, and is provided hereinbelow with reference to the sequence listing part.

[27835] VGAM1991 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1991 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1991 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27836] VGAM1991 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1991 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1991 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1991 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1991 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27837] The complementary binding of VGAM1991 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1991 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1991 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1991 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27838] It is appreciated that VGAM1991 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1991 host target genes. The mRNA of each one of this plurality of VGAM1991 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1991 RNA, herein designated VGAM

RNA, and which when bound by VGAM1991 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1991 host target proteins.

[27839] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1991 gene, herein designated VGAM GENE, on one or more VGAM1991 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27840] It is yet further appreciated that a function of VGAM1991 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1991 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1991 correlate with, and may be deduced from, the identity of the host target genes which VGAM1991 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27841] Nucleotide sequences of the VGAM1991 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1991 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1991 are further described hereinbelow with reference to Table 1.

[27842] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1991 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27843] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1992 (VGAM1992) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27844] VGAM1992 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1992 was detected is described hereinabove with reference to Figs. 2-8.

[27845] VGAM1992 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1992 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27846] VGAM1992 gene, herein designated VGAM GENE, encodes a VGAM1992 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1992 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1992 precursor RNA is designated SEQ ID:1978, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1978 is located at position 12009 relative to the genome of Nipah virus.

[27847] VGAM1992 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27848] An enzyme complex designated DICER COMPLEX, dices the VGAM1992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1992 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1992 RNA is designated SEQ ID:4703, and is provided hereinbelow with reference to the sequence listing part.

[27849] VGAM1992 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1992 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1992 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27850] VGAM1992 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1992 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1992 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1992 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1992 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27851] The complementary binding of VGAM1992 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1992 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1992 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1992 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27852] It is appreciated that VGAM1992 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1992 host target genes. The mRNA of each one of this plurality of VGAM1992 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1992 RNA, herein designated VGAM

RNA, and which when bound by VGAM1992 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1992 host target proteins.

[27853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1992 gene, herein designated VGAM GENE, on one or more VGAM1992 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27854] It is yet further appreciated that a function of VGAM1992 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1992 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1992 correlate with, and may be deduced from, the identity of the host target genes which VGAM1992 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27855] Nucleotide sequences of the VGAM1992 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1992 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1992 are further described hereinbelow with reference to Table 1.

[27856] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1992 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27857] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1993 (VGAM1993) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27858] VGAM1993 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1993 was detected is described hereinabove with reference to Figs. 2-8.

[27859] VGAM1993 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1993 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27860] VGAM1993 gene, herein designated VGAM GENE, encodes a VGAM1993 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1993 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1993 precursor RNA is designated SEQ ID:1979, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1979 is located at position 17946 relative to the genome of Nipah virus.

[27861] VGAM1993 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27862] An enzyme complex designated DICER COMPLEX, dices the VGAM1993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1993 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1993 RNA is designated SEQ ID:4704, and is provided hereinbelow with reference to the sequence listing part.

[27863] VGAM1993 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1993 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1993 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27864] VGAM1993 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1993 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1993 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1993 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1993 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27865] The complementary binding of VGAM1993 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1993 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1993 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1993 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27866] It is appreciated that VGAM1993 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1993 host target genes. The mRNA of each one of this plurality of VGAM1993 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1993 RNA, herein designated VGAM

RNA, and which when bound by VGAM1993 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1993 host target proteins.

[27867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1993 gene, herein designated VGAM GENE, on one or more VGAM1993 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27868] It is yet further appreciated that a function of VGAM1993 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1993 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1993 correlate with, and may be deduced from, the identity of the host target genes which VGAM1993 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27869] Nucleotide sequences of the VGAM1993 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1993 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1993 are further described hereinbelow with reference to Table 1.

[27870] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1993 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27871] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1994 (VGAM1994) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27872] VGAM1994 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1994 was detected is described hereinabove with reference to Figs. 2-8.

[27873] VGAM1994 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1994 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27874] VGAM1994 gene, herein designated VGAM GENE, encodes a VGAM1994 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1994 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1994 precursor RNA is designated SEQ ID:1980, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1980 is located at position 17237 relative to the genome of Nipah virus.

[27875] VGAM1994 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27876] An enzyme complex designated DICER COMPLEX, dices the VGAM1994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1994 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM1994 RNA is designated SEQ ID:4705, and is provided hereinbelow with reference to the sequence listing part.

[27877] VGAM1994 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1994 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1994 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27878] VGAM1994 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1994 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1994 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1994 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1994 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27879] The complementary binding of VGAM1994 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1994 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1994 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1994 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27880] It is appreciated that VGAM1994 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1994 host target genes. The mRNA of each one of this plurality of VGAM1994 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1994 RNA, herein designated VGAM

RNA, and which when bound by VGAM1994 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1994 host target proteins.

[27881] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1994 gene, herein designated VGAM GENE, on one or more VGAM1994 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27882] It is yet further appreciated that a function of VGAM1994 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1994 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1994 correlate with, and may be deduced from, the identity of the host target genes which VGAM1994 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27883] Nucleotide sequences of the VGAM1994 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1994 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1994 are further described hereinbelow with reference to Table 1.

[27884] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1994 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27885] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1995 (VGAM1995) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27886] VGAM1995 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1995 was detected is described hereinabove with reference to Figs. 2-8.

[27887] VGAM1995 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1995 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27888] VGAM1995 gene, herein designated VGAM GENE, encodes a VGAM1995 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1995 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1995 precursor RNA is designated SEQ ID:1981, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1981 is located at position 9693 relative to the genome of Nipah virus.

[27889] VGAM1995 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27890] An enzyme complex designated DICER COMPLEX, dices the VGAM1995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1995 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1995 RNA is designated SEQ ID:4706, and is provided hereinbelow with reference to the sequence listing part.

[27891] VGAM1995 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1995 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1995 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27892] VGAM1995 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1995 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1995 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1995 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1995 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27893] The complementary binding of VGAM1995 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1995 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1995 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1995 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27894] It is appreciated that VGAM1995 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1995 host target genes. The mRNA of each one of this plurality of VGAM1995 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1995 RNA, herein designated VGAM

RNA, and which when bound by VGAM1995 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1995 host target proteins.

[27895] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1995 gene, herein designated VGAM GENE, on one or more VGAM1995 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27896] It is yet further appreciated that a function of VGAM1995 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1995 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1995 correlate with, and may be deduced from, the identity of the host target genes which VGAM1995 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27897] Nucleotide sequences of the VGAM1995 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1995 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1995 are further described hereinbelow with reference to Table 1.

[27898] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1995 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27899] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1996 (VGAM1996) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27900] VGAM1996 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1996 was detected is described hereinabove with reference to Figs. 2-8.

[27901] VGAM1996 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1996 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27902] VGAM1996 gene, herein designated VGAM GENE, encodes a VGAM1996 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1996 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1996 precursor RNA is designated SEQ ID:1982, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1982 is located at position 8558 relative to the genome of Nipah virus.

[27903] VGAM1996 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27904] An enzyme complex designated DICER COMPLEX, dices the VGAM1996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1996 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1996 RNA is designated SEQ ID:4707, and is provided hereinbelow with reference to the sequence listing part.

[27905] VGAM1996 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1996 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1996 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27906] VGAM1996 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1996 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1996 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1996 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1996 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27907] The complementary binding of VGAM1996 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1996 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1996 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1996 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27908] It is appreciated that VGAM1996 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1996 host target genes. The mRNA of each one of this plurality of VGAM1996 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1996 RNA, herein designated VGAM

RNA, and which when bound by VGAM1996 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1996 host target proteins.

[27909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1996 gene, herein designated VGAM GENE, on one or more VGAM1996 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27910] It is yet further appreciated that a function of VGAM1996 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1996 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1996 correlate with, and may be deduced from, the identity of the host target genes which VGAM1996 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27911] Nucleotide sequences of the VGAM1996 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1996 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1996 are further described hereinbelow with reference to Table 1.

[27912] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1996 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27913] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1997 (VGAM1997) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27914] VGAM1997 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1997 was detected is described hereinabove with reference to Figs. 2-8.

[27915] VGAM1997 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1997 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27916] VGAM1997 gene, herein designated VGAM GENE, encodes a VGAM1997 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1997 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1997 precursor RNA is designated SEQ ID:1983, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1983 is located at position 1708 relative to the genome of Nipah virus.

[27917] VGAM1997 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27918] An enzyme complex designated DICER COMPLEX, dices the VGAM1997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1997 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1997 RNA is designated SEQ ID:4708, and is provided hereinbelow with reference to the sequence listing part.

[27919] VGAM1997 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1997 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1997 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27920] VGAM1997 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1997 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1997 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1997 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1997 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27921] The complementary binding of VGAM1997 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1997 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1997 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1997 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27922] It is appreciated that VGAM1997 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1997 host target genes. The mRNA of each one of this plurality of VGAM1997 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1997 RNA, herein designated VGAM

RNA, and which when bound by VGAM1997 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1997 host target proteins.

[27923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1997 gene, herein designated VGAM GENE, on one or more VGAM1997 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27924] It is yet further appreciated that a function of VGAM1997 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1997 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1997 correlate with, and may be deduced from, the identity of the host target genes which VGAM1997 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27925] Nucleotide sequences of the VGAM1997 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1997 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1997 are further described hereinbelow with reference to Table 1.

[27926] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1997 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27927] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1998 (VGAM1998) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27928] VGAM1998 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1998 was detected is described hereinabove with reference to Figs. 2-8.

[27929] VGAM1998 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1998 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27930] VGAM1998 gene, herein designated VGAM GENE, encodes a VGAM1998 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1998 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1998 precursor RNA is designated SEQ ID:1984, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1984 is located at position 15895 relative to the genome of Nipah virus.

[27931] VGAM1998 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27932] An enzyme complex designated DICER COMPLEX, dices the VGAM1998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1998 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1998 RNA is designated SEQ ID:4709, and is provided hereinbelow with reference to the sequence listing part.

[27933] VGAM1998 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1998 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1998 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27934] VGAM1998 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1998 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1998 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1998 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1998 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27935] The complementary binding of VGAM1998 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1998 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1998 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1998 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27936] It is appreciated that VGAM1998 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1998 host target genes. The mRNA of each one of this plurality of VGAM1998 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1998 RNA, herein designated VGAM

RNA, and which when bound by VGAM1998 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1998 host target proteins.

[27937] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1998 gene, herein designated VGAM GENE, on one or more VGAM1998 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27938] It is yet further appreciated that a function of VGAM1998 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1998 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1998 correlate with, and may be deduced from, the identity of the host target genes which VGAM1998 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27939] Nucleotide sequences of the VGAM1998 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1998 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1998 are further described hereinbelow with reference to Table 1.

[27940] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1998 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27941] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1999 (VGAM1999) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27942] VGAM1999 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1999 was detected is described hereinabove with reference to Figs. 2-8.

[27943] VGAM1999 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM1999 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27944] VGAM1999 gene, herein designated VGAM GENE, encodes a VGAM1999 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1999 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1999 precursor RNA is designated SEQ ID:1985, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1985 is located at position 11709 relative to the genome of Nipah virus.

[27945] VGAM1999 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27946] An enzyme complex designated DICER COMPLEX, dices the VGAM1999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1999 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1999 RNA is designated SEQ ID:4710, and is provided hereinbelow with reference to the sequence listing part.

[27947] VGAM1999 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1999 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1999 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27948] VGAM1999 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1999 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1999 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1999 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1999 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27949] The complementary binding of VGAM1999 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1999 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1999 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1999 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27950] It is appreciated that VGAM1999 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1999 host target genes. The mRNA of each one of this plurality of VGAM1999 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1999 RNA, herein designated VGAM

RNA, and which when bound by VGAM1999 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1999 host target proteins.

[27951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1999 gene, herein designated VGAM GENE, on one or more VGAM1999 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27952] It is yet further appreciated that a function of VGAM1999 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1999 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM1999 correlate with, and may be deduced from, the identity of the host target genes which VGAM1999 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27953] Nucleotide sequences of the VGAM1999 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1999 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1999 are further described hereinbelow with reference to Table 1.

[27954] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1999 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27955] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2000 (VGAM2000) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27956] VGAM2000 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2000 was detected is described hereinabove with reference to Figs. 2-8.

[27957] VGAM2000 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM2000 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27958] VGAM2000 gene, herein designated VGAM GENE, encodes a VGAM2000 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2000 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2000 precursor RNA is designated SEQ ID:1986, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1986 is located at position 10918 relative to the genome of Nipah virus.

[27959] VGAM2000 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27960] An enzyme complex designated DICER COMPLEX, dices the VGAM2000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2000 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2000 RNA is designated SEQ ID:4711, and is provided hereinbelow with reference to the sequence listing part.

[27961] VGAM2000 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2000 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2000 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27962] VGAM2000 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2000 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2000 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2000 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2000 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27963] The complementary binding of VGAM2000 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2000 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2000 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2000 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27964] It is appreciated that VGAM2000 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2000 host target genes. The mRNA of each one of this plurality of VGAM2000 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2000 RNA, herein designated VGAM

RNA, and which when bound by VGAM2000 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2000 host target proteins.

[27965] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2000 gene, herein designated VGAM GENE, on one or more VGAM2000 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27966] It is yet further appreciated that a function of VGAM2000 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2000 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM2000 correlate with, and may be deduced from, the identity of the host target genes which VGAM2000 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27967] Nucleotide sequences of the VGAM2000 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2000 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2000 are further described hereinbelow with reference to Table 1.

[27968] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2000 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27969] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2001 (VGAM2001) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27970] VGAM2001 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2001 was detected is described hereinabove with reference to Figs. 2-8.

[27971] VGAM2001 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM2001 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27972] VGAM2001 gene, herein designated VGAM GENE, encodes a VGAM2001 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2001 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2001 precursor RNA is designated SEQ ID:1987, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1987 is located at position 2273 relative to the genome of Nipah virus.

[27973] VGAM2001 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27974] An enzyme complex designated DICER COMPLEX, dices the VGAM2001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2001 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM2001 RNA is designated SEQ ID:4712, and is provided hereinbelow with reference to the sequence listing part.

[27975] VGAM2001 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2001 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2001 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27976] VGAM2001 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2001 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2001 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2001 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2001 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27977] The complementary binding of VGAM2001 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2001 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2001 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2001 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27978] It is appreciated that VGAM2001 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2001 host target genes. The mRNA of each one of this plurality of VGAM2001 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2001 RNA, herein designated VGAM

RNA, and which when bound by VGAM2001 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2001 host target proteins.

[27979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2001 gene, herein designated VGAM GENE, on one or more VGAM2001 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27980] It is yet further appreciated that a function of VGAM2001 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2001 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM2001 correlate with, and may be deduced from, the identity of the host target genes which VGAM2001 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27981] Nucleotide sequences of the VGAM2001 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2001 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2001 are further described hereinbelow with reference to Table 1.

[27982] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2001 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27983] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2002 (VGAM2002) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27984] VGAM2002 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2002 was detected is described hereinabove with reference to Figs. 2-8.

[27985] VGAM2002 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM2002 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27986] VGAM2002 gene, herein designated VGAM GENE, encodes a VGAM2002 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2002 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2002 precursor RNA is designated SEQ ID:1988, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1988 is located at position 1516 relative to the genome of Nipah virus.

[27987] VGAM2002 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27988] An enzyme complex designated DICER COMPLEX, dices the VGAM2002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2002 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2002 RNA is designated SEQ ID:4713, and is provided hereinbelow with reference to the sequence listing part.

[27989] VGAM2002 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2002 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2002 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27990] VGAM2002 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2002 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2002 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2002 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2002 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27991] The complementary binding of VGAM2002 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2002 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2002 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2002 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27992] It is appreciated that VGAM2002 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2002 host target genes. The mRNA of each one of this plurality of VGAM2002 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2002 RNA, herein designated VGAM

RNA, and which when bound by VGAM2002 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2002 host target proteins.

[27993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2002 gene, herein designated VGAM GENE, on one or more VGAM2002 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27994] It is yet further appreciated that a function of VGAM2002 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2002 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM2002 correlate with, and may be deduced from, the identity of the host target genes which VGAM2002 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27995] Nucleotide sequences of the VGAM2002 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2002 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2002 are further described hereinbelow with reference to Table 1.

[27996] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2002 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27997] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2003 (VGAM2003) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27998] VGAM2003 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2003 was detected is described hereinabove with reference to Figs. 2-8.

[27999] VGAM2003 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Nipah virus. VGAM2003 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28000] VGAM2003 gene, herein designated VGAM GENE, encodes a VGAM2003 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2003 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2003 precursor RNA is designated SEQ ID:1989, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1989 is located at position 5319 relative to the genome of Nipah virus.

[28001] VGAM2003 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28002] An enzyme complex designated DICER COMPLEX, dices the VGAM2003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2003 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2003 RNA is designated SEQ ID:4714, and is provided hereinbelow with reference to the sequence listing part.

[28003] VGAM2003 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2003 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2003 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28004] VGAM2003 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2003 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2003 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2003 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2003 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28005] The complementary binding of VGAM2003 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2003 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2003 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2003 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28006] It is appreciated that VGAM2003 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2003 host target genes. The mRNA of each one of this plurality of VGAM2003 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2003 RNA, herein designated VGAM

RNA, and which when bound by VGAM2003 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2003 host target proteins.

[28007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2003 gene, herein designated VGAM GENE, on one or more VGAM2003 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28008] It is yet further appreciated that a function of VGAM2003 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2003 include diagnosis, prevention and treatment of viral infection by Nipah virus. Specific functions, and accordingly utilities, of VGAM2003 correlate with, and may be deduced from, the identity of the host target genes which VGAM2003 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28009] Nucleotide sequences of the VGAM2003 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2003 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2003 are further described hereinbelow with reference to Table 1.

[28010] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2003 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28011] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2004 (VGAM2004) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28012] VGAM2004 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2004 was detected is described hereinabove with reference to Figs. 2-8.

[28013] VGAM2004 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2004 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28014] VGAM2004 gene, herein designated VGAM GENE, encodes a VGAM2004 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2004 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2004 precursor RNA is designated SEQ ID:1990, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1990 is located at position

177784 relative to the genome of Chimpanzee cytomegalovirus.

[28015] VGAM2004 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28016] An enzyme complex designated DICER COMPLEX, dices the VGAM2004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2004 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2004 RNA is designated SEQ ID:4715, and is provided hereinbelow with reference to the sequence

listing part.

[28017] VGAM2004 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2004 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2004 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28018] VGAM2004 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2004 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2004 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2004 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2004 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28019] The complementary binding of VGAM2004 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2004 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2004 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2004 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28020] It is appreciated that VGAM2004 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2004 host target genes. The mRNA of each one of this plurality of VGAM2004 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2004 RNA, herein designated VGAM RNA, and which when bound by VGAM2004 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2004 host target proteins.

[28021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2004 gene, herein designated VGAM GENE, on one or more VGAM2004 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28022] It is yet further appreciated that a function of VGAM2004

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2004 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2004 correlate with, and may be deduced from, the identity of the host target genes which VGAM2004 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28023] Nucleotide sequences of the VGAM2004 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2004 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2004 are further described hereinbelow with reference to Table 1.

[28024] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2004 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28025] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2005 (VGAM2005) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28026] VGAM2005 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2005 was detected is described hereinabove with reference to Figs. 2-8.

[28027] VGAM2005 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2005 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28028] VGAM2005 gene, herein designated VGAM GENE, encodes a VGAM2005 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2005 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2005 precursor RNA is designated SEQ ID:1991, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1991 is located at position 177914 relative to the genome of Chimpanzee cytomegalovirus.

[28029] VGAM2005 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28030] An enzyme complex designated DICER COMPLEX, dices the VGAM2005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2005 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM2005 RNA is designated SEQ ID:4716, and is provided hereinbelow with reference to the sequence listing part.

[28031] VGAM2005 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2005 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2005 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28032] VGAM2005 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2005 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2005 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2005 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2005 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28033] The complementary binding of VGAM2005 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2005 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2005 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2005 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28034] It is appreciated that VGAM2005 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2005 host target genes. The mRNA of

each one of this plurality of VGAM2005 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2005 RNA, herein designated VGAM RNA, and which when bound by VGAM2005 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2005 host target proteins.

[28035] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2005 gene, herein designated VGAM GENE, on one or more VGAM2005 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[28036] It is yet further appreciated that a function of VGAM2005 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2005 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2005 correlate with, and may be deduced from, the identity of the host target genes which VGAM2005 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28037] Nucleotide sequences of the VGAM2005 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2005 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2005 are further described hereinbelow with reference to Table 1.

[28038] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2005 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[28039] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2006 (VGAM2006) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28040] VGAM2006 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2006 was detected is described hereinabove with reference to Figs. 2-8.

[28041] VGAM2006 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2006 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28042] VGAM2006 gene, herein designated VGAM GENE, encodes a VGAM2006 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2006 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2006 precursor RNA is designated SEQ ID:1992, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1992 is located at position 191561 relative to the genome of Chimpanzee cytomegalovirus.

[28043] VGAM2006 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28044] An enzyme complex designated DICER COMPLEX, dices the VGAM2006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2006 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2006 RNA is designated SEQ ID:4717, and is provided hereinbelow with reference to the sequence listing part.

[28045] VGAM2006 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2006 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2006 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28046] VGAM2006 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2006 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2006 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2006 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2006 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28047] The complementary binding of VGAM2006 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2006 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2006 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2006 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28048] It is appreciated that VGAM2006 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2006 host target genes. The mRNA of each one of this plurality of VGAM2006 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2006 RNA, herein designated VGAM RNA, and which when bound by VGAM2006 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2006 host target proteins.

[28049] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2006 gene, herein designated VGAM GENE, on one or more VGAM2006 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28050] It is yet further appreciated that a function of VGAM2006 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2006 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2006 correlate with, and may be deduced from, the identity of the host target genes which VGAM2006 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28051] Nucleotide sequences of the VGAM2006 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2006 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2006 are further described hereinbelow with reference to Table 1.

[28052] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2006 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28053] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2007 (VGAM2007) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28054] VGAM2007 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2007 was detected is described hereinabove with reference to Figs. 2-8.

[28055] VGAM2007 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus (REBOV). VGAM2007 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28056] VGAM2007 gene, herein designated VGAM GENE, encodes a VGAM2007 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2007 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2007 precursor RNA is designated SEQ ID:1993, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1993 is located at position 5965 relative to the genome of Reston Ebola virus (REBOV).

[28057] VGAM2007 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28058] An enzyme complex designated DICER COMPLEX, dices the VGAM2007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2007 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2007 RNA is designated SEQ ID:4718, and is provided hereinbelow with reference to the sequence listing part.

[28059] VGAM2007 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2007 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2007 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28060] VGAM2007 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2007 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2007 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2007 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2007 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28061] The complementary binding of VGAM2007 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2007 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2007 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2007 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28062] It is appreciated that VGAM2007 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2007 host target genes. The mRNA of each one of this plurality of VGAM2007 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2007 RNA, herein designated VGAM RNA, and which when bound by VGAM2007 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2007 host target proteins.

[28063] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2007 gene, herein designated VGAM GENE, on one or more VGAM2007 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28064] It is yet further appreciated that a function of VGAM2007 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2007 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus (REBOV). Specific functions, and accordingly utilities, of VGAM2007 correlate with, and may be deduced from, the identity of the host target genes which VGAM2007 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28065] Nucleotide sequences of the VGAM2007 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2007 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2007 are further described hereinbelow with reference to Table 1.

[28066] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2007 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28067] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2008 (VGAM2008) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28068] VGAM2008 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2008 was detected is described hereinabove with reference to Figs. 2-8.

[28069] VGAM2008 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus (REBOV). VGAM2008 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28070] VGAM2008 gene, herein designated VGAM GENE, encodes a VGAM2008 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2008 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2008 precursor RNA is designated SEQ ID:1994, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1994 is located at position 11658 relative to the genome of Reston Ebola virus (REBOV).

[28071] VGAM2008 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28072] An enzyme complex designated DICER COMPLEX, dices the VGAM2008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2008 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2008 RNA is designated SEQ ID:4719, and is provided hereinbelow with reference to the sequence listing part.

[28073] VGAM2008 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2008 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2008 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28074] VGAM2008 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2008 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2008 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2008 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2008 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28075] The complementary binding of VGAM2008 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2008 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2008 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2008 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28076] It is appreciated that VGAM2008 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2008 host target genes. The mRNA of each one of this plurality of VGAM2008 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2008 RNA, herein designated VGAM RNA, and which when bound by VGAM2008 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2008 host target proteins.

[28077] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2008 gene, herein designated VGAM GENE, on one or more VGAM2008 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28078] It is yet further appreciated that a function of VGAM2008 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2008 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus (REBOV). Specific functions, and accordingly utilities, of VGAM2008 correlate with, and may be deduced from, the identity of the host target genes which VGAM2008 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28079] Nucleotide sequences of the VGAM2008 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2008 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2008 are further described hereinbelow with reference to Table 1.

[28080] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2008 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28081] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2009 (VGAM2009) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28082] VGAM2009 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2009 was detected is described hereinabove with reference to Figs. 2-8.

[28083] VGAM2009 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus (REBOV). VGAM2009 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28084] VGAM2009 gene, herein designated VGAM GENE, encodes

a VGAM2009 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2009 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2009 precursor RNA is designated SEQ ID:1995, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1995 is located at position 12590 relative to the genome of Reston Ebola virus (REBOV).

[28085] VGAM2009 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28086] An enzyme complex designated DICER COMPLEX, dices the VGAM2009 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2009 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2009 RNA is designated SEQ ID:4720, and is provided hereinbelow with reference to the sequence listing part.

[28087] VGAM2009 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2009 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2009 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28088] VGAM2009 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2009 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2009 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2009 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2009 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28089] The complementary binding of VGAM2009 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2009 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2009

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2009 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28090] It is appreciated that VGAM2009 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2009 host target genes. The mRNA of each one of this plurality of VGAM2009 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2009 RNA, herein designated VGAM RNA, and which when bound by VGAM2009 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2009 host target proteins.

[28091] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2009 gene, herein designated VGAM GENE, on one or more VGAM2009 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28092] It is yet further appreciated that a function of VGAM2009 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2009 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus (REBOV). Specific functions, and accordingly utilities, of VGAM2009 correlate with, and may be deduced from, the identity of the host target genes which VGAM2009 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28093] Nucleotide sequences of the VGAM2009 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2009 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2009 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2009 are further described hereinbelow with reference to Table 1.

[28094] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2009 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28095] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2010 (VGAM2010) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28096] VGAM2010 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2010 was detected is described hereinabove with reference to Figs. 2-8.

[28097] VGAM2010 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus (REBOV). VGAM2010 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[28098] VGAM2010 gene, herein designated VGAM GENE, encodes a VGAM2010 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2010 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2010 precursor RNA is designated SEQ ID:1996, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1996 is located at position 17622 relative to the genome of Reston Ebola virus (REBOV).

[28099] VGAM2010 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28100] An enzyme complex designated DICER COMPLEX, dices the VGAM2010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2010 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM2010 RNA is designated SEQ ID:4721, and is provided hereinbelow with reference to the sequence listing part.

[28101] VGAM2010 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2010 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2010 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28102] VGAM2010 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2010 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2010 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2010 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2010 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28103] The complementary binding of VGAM2010 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2010 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2010 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2010 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28104] It is appreciated that VGAM2010 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2010 host target genes. The mRNA of each one of this plurality of VGAM2010 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2010 RNA, herein designated VGAM RNA, and which when bound by VGAM2010 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2010 host target proteins.

[28105] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2010 gene, herein designated VGAM GENE, on one or more VGAM2010 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28106] It is yet further appreciated that a function of VGAM2010 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2010 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus (REBOV). Specific functions, and accordingly utilities, of VGAM2010 correlate with, and may be deduced from, the identity of the host target genes which VGAM2010 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28107] Nucleotide sequences of the VGAM2010 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2010 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2010 are further described hereinbelow with reference to Table 1.

[28108] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2010 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28109] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2011 (VGAM2011) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28110] VGAM2011 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2011 was detected is described hereinabove with reference to Figs. 2-8.

[28111] VGAM2011 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus

(REBOV). VGAM2011 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28112] VGAM2011 gene, herein designated VGAM GENE, encodes a VGAM2011 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2011 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2011 precursor RNA is designated SEQ ID:1997, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1997 is located at position 4098 relative to the genome of Reston Ebola virus (REBOV).

[28113] VGAM2011 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[28114] An enzyme complex designated DICER COMPLEX, dices the VGAM2011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2011 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2011 RNA is designated SEQ ID:4722, and is provided hereinbelow with reference to the sequence listing part.

[28115] VGAM2011 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2011 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2011 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28116] VGAM2011 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2011 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2011 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2011 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2011 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28117] The complementary binding of VGAM2011 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2011 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2011 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2011 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28118] It is appreciated that VGAM2011 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2011 host target genes. The mRNA of each one of this plurality of VGAM2011 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2011 RNA, herein designated VGAM RNA, and which when bound by VGAM2011 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2011 host target proteins.

[28119] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2011 gene, herein designated VGAM GENE, on one or more VGAM2011 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28120] It is yet further appreciated that a function of VGAM2011 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2011 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus (REBOV). Specific functions, and accordingly utilities, of VGAM2011 correlate with, and may be deduced from, the identity of the host target genes which VGAM2011 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28121] Nucleotide sequences of the VGAM2011 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2011 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2011 are further described hereinbelow with reference to Table 1.

[28122] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2011 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28123] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2012 (VGAM2012) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28124] VGAM2012 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2012 was detected is described hereinabove with reference to Figs. 2-8.

[28125] VGAM2012 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Reston Ebola virus (REBOV). VGAM2012 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28126] VGAM2012 gene, herein designated VGAM GENE, encodes a VGAM2012 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2012 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2012 precursor RNA is designated SEQ ID:1998, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1998 is located at position 16890 relative to the genome of Reston Ebola virus (REBOV).

[28127] VGAM2012 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28128] An enzyme complex designated DICER COMPLEX, dices the VGAM2012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2012 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2012 RNA is designated SEQ ID:4723, and is provided hereinbelow with reference to the sequence listing part.

[28129] VGAM2012 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2012 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2012 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[28130] VGAM2012 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2012 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2012 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2012 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2012 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28131] The complementary binding of VGAM2012 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2012 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2012 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2012 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28132] It is appreciated that VGAM2012 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2012 host target genes. The mRNA of each one of this plurality of VGAM2012 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2012 RNA, herein designated VGAM RNA, and which when bound by VGAM2012 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2012 host target proteins.

[28133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2012 gene, herein designated VGAM GENE, on one

or more VGAM2012 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28134] It is yet further appreciated that a function of VGAM2012 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2012 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus (REBOV). Specific functions, and accordingly utilities, of VGAM2012 correlate with, and may be deduced from, the identity of the host target genes which VGAM2012 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28135] Nucleotide sequences of the VGAM2012 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2012 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2012 are further described hereinbelow with reference to Table 1.

[28136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2012 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28137] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2013 (VGAM2013) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28138] VGAM2013 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2013 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[28139] VGAM2013 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus (REBOV). VGAM2013 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28140] VGAM2013 gene, herein designated VGAM GENE, encodes a VGAM2013 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2013 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2013 precursor RNA is designated SEQ ID:1999, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1999 is located at position 12733 relative to the genome of Reston Ebola virus (REBOV).

[28141] VGAM2013 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28142] An enzyme complex designated DICER COMPLEX, dices the VGAM2013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2013 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2013 RNA is designated SEQ ID:4724, and is provided hereinbelow with reference to the sequence listing part.

[28143] VGAM2013 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2013 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2013 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28144] VGAM2013 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2013 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2013 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2013 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2013 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28145] The complementary binding of VGAM2013 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2013 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2013 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2013 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28146] It is appreciated that VGAM2013 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2013 host target genes. The mRNA of each one of this plurality of VGAM2013 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2013 RNA, herein designated VGAM RNA, and which when bound by VGAM2013 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2013 host target proteins.

[28147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2013 gene, herein designated VGAM GENE, on one or more VGAM2013 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28148] It is yet further appreciated that a function of VGAM2013 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2013 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus (REBOV). Specific functions, and accordingly utilities, of VGAM2013 correlate with, and may be deduced from, the identity of the host target genes which VGAM2013 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[28149] Nucleotide sequences of the VGAM2013 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2013 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2013 are further described hereinbelow with reference to Table 1.

[28150] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2013 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28151] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2014 (VGAM2014) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28152] VGAM2014 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2014 was detected is described hereinabove with reference to Figs. 2-8.

[28153] VGAM2014 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus (REBOV). VGAM2014 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28154] VGAM2014 gene, herein designated VGAM GENE, encodes a VGAM2014 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2014 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2014 precursor RNA is designated SEQ ID:2000, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2000 is located at position 13026 relative to the genome of Reston Ebola virus (REBOV).

[28155] VGAM2014 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2014 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28156] An enzyme complex designated DICER COMPLEX, dices the VGAM2014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2014 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2014 RNA is designated SEQ ID:4725, and is provided hereinbelow with reference to the sequence listing part.

[28157] VGAM2014 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2014 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2014 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28158] VGAM2014 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2014 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2014 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2014 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2014 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28159] The complementary binding of VGAM2014 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2014 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2014 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2014 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28160] It is appreciated that VGAM2014 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2014 host target genes. The mRNA of each one of this plurality of VGAM2014 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2014 RNA, herein designated VGAM RNA, and which when bound by VGAM2014 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2014 host target proteins.

[28161] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2014 gene, herein designated VGAM GENE, on one or more VGAM2014 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28162] It is yet further appreciated that a function of VGAM2014 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2014 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus (REBOV). Specific functions, and accordingly utilities, of VGAM2014

correlate with, and may be deduced from, the identity of the host target genes which VGAM2014 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28163] Nucleotide sequences of the VGAM2014 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2014 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2014 are further described hereinbelow with reference to Table 1.

[28164] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2014 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28165] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2015 (VGAM2015) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[28166] VGAM2015 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2015 was detected is described hereinabove with reference to Figs. 2-8.

[28167] VGAM2015 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2015 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28168] VGAM2015 gene, herein designated VGAM GENE, encodes a VGAM2015 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2015 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2015 precursor RNA is designated SEQ ID:2001, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2001 is located at position 4081 relative to the genome of Kyuri green mottle mosaic virus.

[28169] VGAM2015 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2015 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28170] An enzyme complex designated DICER COMPLEX, dices the VGAM2015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2015 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2015 RNA is designated SEQ ID:4726, and is provided hereinbelow with reference to the sequence listing part.

[28171] VGAM2015 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2015 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2015 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28172] VGAM2015 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2015 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2015 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2015 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2015 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28173] The complementary binding of VGAM2015 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2015 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2015 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2015 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28174] It is appreciated that VGAM2015 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2015 host target genes. The mRNA of each one of this plurality of VGAM2015 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2015 RNA, herein designated VGAM RNA, and which when bound by VGAM2015 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2015 host target proteins.

[28175] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2015 gene, herein designated VGAM GENE, on one or more VGAM2015 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28176] It is yet further appreciated that a function of VGAM2015 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2015 include diagnosis, prevention and treatment of viral infection by Kyuri green mottle mosaic

virus. Specific functions, and accordingly utilities, of VGAM2015 correlate with, and may be deduced from, the identity of the host target genes which VGAM2015 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28177] Nucleotide sequences of the VGAM2015 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2015 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2015 are further described hereinbelow with reference to Table 1.

[28178] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2015 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28179] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2016 (VGAM2016) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[28180] VGAM2016 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2016 was detected is described hereinabove with reference to Figs. 2-8.

[28181] VGAM2016 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2016 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28182] VGAM2016 gene, herein designated VGAM GENE, encodes a VGAM2016 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2016 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2016 precursor RNA is designated SEQ ID:2002, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2002 is located at position 1496 relative to the genome of Kyuri green mottle mosaic virus.

[28183] VGAM2016 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28184] An enzyme complex designated DICER COMPLEX, dices the VGAM2016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2016 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2016 RNA is designated SEQ ID:4727, and is provided hereinbelow with reference to the sequence listing part.

[28185] VGAM2016 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2016 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2016 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28186] VGAM2016 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2016 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2016 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2016 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2016 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28187] The complementary binding of VGAM2016 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2016 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2016 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2016 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28188] It is appreciated that VGAM2016 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2016 host target genes. The mRNA of each one of this plurality of VGAM2016 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2016 RNA, herein designated VGAM RNA, and which when bound by VGAM2016 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2016 host target proteins.

[28189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2016 gene, herein designated VGAM GENE, on one or more VGAM2016 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28190] It is yet further appreciated that a function of VGAM2016 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2016 include diagnosis, prevention and

treatment of viral infection by Kyuri green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM2016 correlate with, and may be deduced from, the identity of the host target genes which VGAM2016 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28191] Nucleotide sequences of the VGAM2016 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2016 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2016 are further described hereinbelow with reference to Table 1.

[28192] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2016 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28193] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2017 (VGAM2017) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28194] VGAM2017 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2017 was detected is described hereinabove with reference to Figs. 2-8.

[28195] VGAM2017 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2017 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28196] VGAM2017 gene, herein designated VGAM GENE, encodes a VGAM2017 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2017 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2017 precursor RNA is designated SEQ ID:2003, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2003 is located at position 15595 relative to the genome of Zaire Ebola virus (ZEBOV).

[28197] VGAM2017 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28198] An enzyme complex designated DICER COMPLEX, dices the VGAM2017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2017 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM2017 RNA is designated SEQ ID:4728, and is provided hereinbelow with reference to the sequence listing part.

[28199] VGAM2017 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2017 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2017 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28200] VGAM2017 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2017 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2017 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2017 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2017 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28201] The complementary binding of VGAM2017 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2017 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2017 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2017 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28202] It is appreciated that VGAM2017 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2017 host target genes. The mRNA of each one of this plurality of VGAM2017 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2017 RNA, herein designated VGAM

RNA, and which when bound by VGAM2017 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2017 host target proteins.

[28203] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2017 gene, herein designated VGAM GENE, on one or more VGAM2017 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28204] It is yet further appreciated that a function of VGAM2017 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2017 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2017 correlate with, and may be deduced from, the identity of the host target genes which VGAM2017 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28205] Nucleotide sequences of the VGAM2017 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2017 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2017 are further described hereinbelow with reference to Table 1.

[28206] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2017 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28207] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2018 (VGAM2018) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28208] VGAM2018 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2018 was detected is described hereinabove with reference to Figs. 2-8.

[28209] VGAM2018 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2018 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28210] VGAM2018 gene, herein designated VGAM GENE, encodes a VGAM2018 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2018 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2018 precursor RNA is designated SEQ ID:2004, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2004 is located at position

13583 relative to the genome of Zaire Ebola virus (ZEBOV).

[28211] VGAM2018 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28212] An enzyme complex designated DICER COMPLEX, dices the VGAM2018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2018 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2018 RNA is designated SEQ ID:4729, and is provided hereinbelow with reference to the sequence listing part.

[28213] VGAM2018 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2018 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2018 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28214] VGAM2018 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2018 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2018 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2018 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2018 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28215] The complementary binding of VGAM2018 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2018 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2018 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2018 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28216] It is appreciated that VGAM2018 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2018 host target genes. The mRNA of each one of this plurality of VGAM2018 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2018 RNA, herein designated VGAM RNA, and which when bound by VGAM2018 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2018 host target proteins.

[28217] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2018 gene, herein designated VGAM GENE, on one or more VGAM2018 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28218] It is yet further appreciated that a function of VGAM2018 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2018 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2018 correlate with, and may be deduced from, the identity of the host target genes which VGAM2018 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28219] Nucleotide sequences of the VGAM2018 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2018 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2018 are further described hereinbelow with reference to Table 1.

[28220] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2018 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28221] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2019 (VGAM2019) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28222] VGAM2019 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2019 was detected is described hereinabove with reference to Figs. 2-8.

[28223] VGAM2019 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2019 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28224] VGAM2019 gene, herein designated VGAM GENE, encodes a VGAM2019 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2019 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2019 precursor RNA is designated SEQ ID:2005, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2005 is located at position 3691 relative to the genome of Kyuri green mottle mosaic virus.

[28225] VGAM2019 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28226] An enzyme complex designated DICER COMPLEX, dices the VGAM2019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2019 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2019 RNA is designated SEQ ID:4730, and is provided hereinbelow with reference to the sequence

listing part.

[28227] VGAM2019 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2019 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2019 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28228] VGAM2019 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2019 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2019 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2019 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2019 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28229] The complementary binding of VGAM2019 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2019 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2019 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2019 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28230] It is appreciated that VGAM2019 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2019 host target genes. The mRNA of each one of this plurality of VGAM2019 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2019 RNA, herein designated VGAM RNA, and which when bound by VGAM2019 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2019 host target proteins.

[28231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2019 gene, herein designated VGAM GENE, on one or more VGAM2019 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28232] It is yet further appreciated that a function of VGAM2019

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2019 include diagnosis, prevention and treatment of viral infection by Kyuri green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM2019 correlate with, and may be deduced from, the identity of the host target genes which VGAM2019 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28233] Nucleotide sequences of the VGAM2019 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2019 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2019 are further described hereinbelow with reference to Table 1.

[28234] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2019 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28235] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2020 (VGAM2020) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28236] VGAM2020 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2020 was detected is described hereinabove with reference to Figs. 2-8.

[28237] VGAM2020 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2020 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28238] VGAM2020 gene, herein designated VGAM GENE, encodes a VGAM2020 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2020 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2020 precursor RNA is designated SEQ ID:2006, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2006 is located at position 8150 relative to the genome of Zaire Ebola virus (ZEBOV).

[28239] VGAM2020 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28240] An enzyme complex designated DICER COMPLEX, dices the VGAM2020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2020 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM2020 RNA is designated SEQ ID:4731, and

is provided hereinbelow with reference to the sequence listing part.

[28241] VGAM2020 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28242] VGAM2020 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2020 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28243] The complementary binding of VGAM2020 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2020 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28244] It is appreciated that VGAM2020 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2020 host target genes. The mRNA of each one of this plurality of VGAM2020 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2020 RNA, herein designated VGAM RNA, and which when bound by VGAM2020 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2020 host target proteins.

[28245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2020 gene, herein designated VGAM GENE, on one or more VGAM2020 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28246] It is yet further appreciated that a function of VGAM2020 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2020 correlate with, and may be deduced from, the identity of the host target genes which VGAM2020 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28247] Nucleotide sequences of the VGAM2020 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2020 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2020 are further described hereinbelow with reference to Table 1.

[28248] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2020 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28249] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2021 (VGAM2021) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28250] VGAM2021 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2021 was detected is described hereinabove with reference to Figs. 2-8.

[28251] VGAM2021 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2021 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28252] VGAM2021 gene, herein designated VGAM GENE, encodes a VGAM2021 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2021 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2021 precur-

sor RNA is designated SEQ ID:2007, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2007 is located at position 11857 relative to the genome of Zaire Ebola virus (ZEBOV).

[28253] VGAM2021 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28254] An enzyme complex designated DICER COMPLEX, dices the VGAM2021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2021 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM2021 RNA is designated SEQ ID:4732, and is provided hereinbelow with reference to the sequence listing part.

[28255] VGAM2021 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28256] VGAM2021 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2021 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28257] The complementary binding of VGAM2021 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2021 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28258] It is appreciated that VGAM2021 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2021 host target genes. The mRNA of

each one of this plurality of VGAM2021 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2021 RNA, herein designated VGAM RNA, and which when bound by VGAM2021 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2021 host target proteins.

[28259] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2021 gene, herein designated VGAM GENE, on one or more VGAM2021 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[28260] It is yet further appreciated that a function of VGAM2021 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2021 correlate with, and may be deduced from, the identity of the host target genes which VGAM2021 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28261] Nucleotide sequences of the VGAM2021 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2021 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2021 are further described hereinbelow with reference to Table 1.

[28262] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2021 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[28263] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2022 (VGAM2022) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28264] VGAM2022 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2022 was detected is described hereinabove with reference to Figs. 2-8.

[28265] VGAM2022 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2022 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28266] VGAM2022 gene, herein designated VGAM GENE, encodes a VGAM2022 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2022 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2022 precursor RNA is designated SEQ ID:2008, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2008 is located at position 4390 relative to the genome of Zaire Ebola virus (ZEBOV).

[28267] VGAM2022 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28268] An enzyme complex designated DICER COMPLEX, dices the VGAM2022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2022 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2022 RNA is designated SEQ ID:4733, and is provided hereinbelow with reference to the sequence listing part.

[28269] VGAM2022 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28270] VGAM2022 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2022 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28271] The complementary binding of VGAM2022 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2022 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28272] It is appreciated that VGAM2022 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2022 host target genes. The mRNA of each one of this plurality of VGAM2022 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2022 RNA, herein designated VGAM RNA, and which when bound by VGAM2022 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2022 host target proteins.

[28273] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2022 gene, herein designated VGAM GENE, on one or more VGAM2022 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28274] It is yet further appreciated that a function of VGAM2022 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2022 correlate with, and may be deduced from, the identity of the host target genes which VGAM2022 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28275] Nucleotide sequences of the VGAM2022 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2022 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2022 are further described hereinbelow with reference to Table 1.

[28276] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2022 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28277] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2023 (VGAM2023) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28278] VGAM2023 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2023 was detected is described hereinabove with reference to Figs. 2-8.

[28279] VGAM2023 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2023 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28280] VGAM2023 gene, herein designated VGAM GENE, encodes a VGAM2023 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2023 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2023 precursor RNA is designated SEQ ID:2009, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2009 is located at position 11139 relative to the genome of Zaire Ebola virus (ZEBOV).

[28281] VGAM2023 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28282] An enzyme complex designated DICER COMPLEX, dices the VGAM2023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2023 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM2023 RNA is designated SEQ ID:4734, and is provided hereinbelow with reference to the sequence listing part.

[28283] VGAM2023 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28284] VGAM2023 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2023 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2023 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28285] The complementary binding of VGAM2023 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2023 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28286] It is appreciated that VGAM2023 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2023 host target genes. The mRNA of each one of this plurality of VGAM2023 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2023 RNA, herein designated VGAM RNA, and which when bound by VGAM2023 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2023 host target proteins.

[28287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2023 gene, herein designated VGAM GENE, on one or more VGAM2023 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28288] It is yet further appreciated that a function of VGAM2023 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2023 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2023 correlate with, and may be deduced from, the identity of the host target genes which VGAM2023 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28289] Nucleotide sequences of the VGAM2023 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2023 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2023 are further described hereinbelow with reference to Table 1.

[28290] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2023 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28291] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2024 (VGAM2024) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28292] VGAM2024 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2024 was detected is described hereinabove with reference to Figs. 2-8.

[28293] VGAM2024 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2024 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28294] VGAM2024 gene, herein designated VGAM GENE, encodes a VGAM2024 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2024 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2024 precursor RNA is designated SEQ ID:2010, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2010 is located at position 332 relative to the genome of Kyuri green mottle mosaic virus.

[28295] VGAM2024 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28296] An enzyme complex designated DICER COMPLEX, dices the VGAM2024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2024 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM2024 RNA is designated SEQ ID:4735, and is provided hereinbelow with reference to the sequence listing part.

[28297] VGAM2024 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28298] VGAM2024 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2024 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28299] The complementary binding of VGAM2024 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2024 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28300] It is appreciated that VGAM2024 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2024 host target genes. The mRNA of each one of this plurality of VGAM2024 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2024 RNA, herein designated VGAM RNA, and which when bound by VGAM2024 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2024 host target proteins.

[28301] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2024 gene, herein designated VGAM GENE, on one or more VGAM2024 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28302] It is yet further appreciated that a function of VGAM2024 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of viral infection by Kyuri green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM2024 correlate with, and may be deduced from, the identity of the host target genes which VGAM2024 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28303] Nucleotide sequences of the VGAM2024 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2024 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2024 are further described hereinbelow with reference to Table 1.

[28304] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2024 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28305] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2025 (VGAM2025) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28306] VGAM2025 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2025 was detected is described hereinabove with reference to Figs. 2-8.

[28307] VGAM2025 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2025 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28308] VGAM2025 gene, herein designated VGAM GENE, encodes a VGAM2025 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2025 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2025 precursor RNA is designated SEQ ID:2011, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2011 is located at position 4374 relative to the genome of Kyuri green mottle mosaic virus.

[28309] VGAM2025 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28310] An enzyme complex designated DICER COMPLEX, dices the VGAM2025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2025 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2025 RNA is designated SEQ ID:4736, and is provided hereinbelow with reference to the sequence listing part.

[28311] VGAM2025 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28312] VGAM2025 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2025 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2025 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28313] The complementary binding of VGAM2025 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2025 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[28314] It is appreciated that VGAM2025 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2025 host target genes. The mRNA of each one of this plurality of VGAM2025 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2025 RNA, herein designated VGAM RNA, and which when bound by VGAM2025 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2025 host target proteins.

[28315] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2025 gene, herein designated VGAM GENE, on one or more VGAM2025 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28316] It is yet further appreciated that a function of VGAM2025 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2025 include diagnosis, prevention and treatment of viral infection by Kyuri green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM2025 correlate with, and may be deduced from, the identity of the host target genes which VGAM2025 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28317] Nucleotide sequences of the VGAM2025 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2025 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2025 are further described hereinbelow with reference to Table 1.

[28318] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2025 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28319] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2026 (VGAM2026) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28320] VGAM2026 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2026 was detected is described hereinabove with reference to Figs. 2-8.

[28321] VGAM2026 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2026 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28322] VGAM2026 gene, herein designated VGAM GENE, encodes a VGAM2026 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2026 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2026 precursor RNA is designated SEQ ID:2012, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2012 is located at position 18253 relative to the genome of Zaire Ebola virus (ZEBOV).

[28323] VGAM2026 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28324] An enzyme complex designated DICER COMPLEX, dices the VGAM2026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2026 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2026 RNA is designated SEQ ID:4737, and is provided hereinbelow with reference to the sequence listing part.

[28325] VGAM2026 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28326] VGAM2026 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2026 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2026 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28327] The complementary binding of VGAM2026 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2026 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28328] It is appreciated that VGAM2026 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2026 host target genes. The mRNA of each one of this plurality of VGAM2026 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2026 RNA, herein designated VGAM RNA, and which when bound by VGAM2026 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2026 host target proteins.

[28329] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2026 gene, herein designated VGAM GENE, on one or more VGAM2026 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28330] It is yet further appreciated that a function of VGAM2026 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2026 correlate with, and may be deduced from, the identity of the host target genes which VGAM2026 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28331] Nucleotide sequences of the VGAM2026 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2026 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2026 are further described hereinbelow with reference to Table 1.

[28332] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2026 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28333] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2027 (VGAM2027) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28334] VGAM2027 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2027 was detected is described hereinabove with reference to Figs. 2-8.

[28335] VGAM2027 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2027 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28336] VGAM2027 gene, herein designated VGAM GENE, encodes

a VGAM2027 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2027 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2027 precursor RNA is designated SEQ ID:2013, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2013 is located at position 4198 relative to the genome of Kyuri green mottle mosaic virus.

[28337] VGAM2027 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28338] An enzyme complex designated DICER COMPLEX, dices the VGAM2027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2027 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2027 RNA is designated SEQ ID:4738, and is provided hereinbelow with reference to the sequence listing part.

[28339] VGAM2027 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28340] VGAM2027 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2027 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2027 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28341] The complementary binding of VGAM2027 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2027 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2027 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28342] It is appreciated that VGAM2027 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2027 host target genes. The mRNA of each one of this plurality of VGAM2027 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2027 RNA, herein designated VGAM RNA, and which when bound by VGAM2027 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2027 host target proteins.

[28343] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2027 gene, herein designated VGAM GENE, on one or more VGAM2027 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28344] It is yet further appreciated that a function of VGAM2027 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2027 include diagnosis, prevention and treatment of viral infection by Kyuri green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM2027 correlate with, and may be deduced from, the identity of the host target genes which VGAM2027 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28345] Nucleotide sequences of the VGAM2027 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2027 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2027 are further

described hereinbelow with reference to Table 1.

[28346] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2027 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28347] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2028 (VGAM2028) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28348] VGAM2028 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2028 was detected is described hereinabove with reference to Figs. 2-8.

[28349] VGAM2028 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2028 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28350] VGAM2028 gene, herein designated VGAM GENE, encodes a VGAM2028 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2028 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2028 precursor RNA is designated SEQ ID:2014, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2014 is located at position 16037 relative to the genome of Zaire Ebola virus (ZEBOV).

[28351] VGAM2028 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28352] An enzyme complex designated DICER COMPLEX, dices the VGAM2028 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2028 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2028 RNA is designated SEQ ID:4739, and is provided hereinbelow with reference to the sequence listing part.

[28353] VGAM2028 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28354] VGAM2028 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2028 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2028 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28355] The complementary binding of VGAM2028 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2028

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2028 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28356] It is appreciated that VGAM2028 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2028 host target genes. The mRNA of each one of this plurality of VGAM2028 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2028 RNA, herein designated VGAM RNA, and which when bound by VGAM2028 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2028 host target proteins.

[28357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2028 gene, herein designated VGAM GENE, on one or more VGAM2028 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28358] It is yet further appreciated that a function of VGAM2028 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2028 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2028 correlate with, and may be deduced from, the identity of the host target genes which VGAM2028 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28359] Nucleotide sequences of the VGAM2028 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2028 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2028 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2028 are further described hereinbelow with reference to Table 1.

[28360] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2028 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28361] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2029 (VGAM2029) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28362] VGAM2029 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2029 was detected is described hereinabove with reference to Figs. 2-8.

[28363] VGAM2029 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2029 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[28364] VGAM2029 gene, herein designated VGAM GENE, encodes a VGAM2029 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2029 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2029 precursor RNA is designated SEQ ID:2015, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2015 is located at position 17355 relative to the genome of Zaire Ebola virus (ZEBOV).

[28365] VGAM2029 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28366] An enzyme complex designated DICER COMPLEX, dices

the VGAM2029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2029 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2029 RNA is designated SEQ ID:4740, and is provided hereinbelow with reference to the sequence listing part.

[28367] VGAM2029 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2029 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2029 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28368] VGAM2029 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2029 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2029 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2029 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2029 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28369] The complementary binding of VGAM2029 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2029 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2029 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2029 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28370] It is appreciated that VGAM2029 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2029 host target genes. The mRNA of each one of this plurality of VGAM2029 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2029 RNA, herein designated VGAM RNA, and which when bound by VGAM2029 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2029 host target proteins.

[28371] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2029 gene, herein designated VGAM GENE, on one or more VGAM2029 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28372] It is yet further appreciated that a function of VGAM2029 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2029 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2029 correlate with, and may be deduced from, the identity of the host target genes which VGAM2029 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28373] Nucleotide sequences of the VGAM2029 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2029 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2029 are further described hereinbelow with reference to Table 1.

[28374] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2029 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28375] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2030 (VGAM2030) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28376] VGAM2030 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2030 was detected is described hereinabove with reference to Figs. 2-8.

[28377] VGAM2030 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2030 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28378] VGAM2030 gene, herein designated VGAM GENE, encodes a VGAM2030 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2030 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2030 precursor RNA is designated SEQ ID:2016, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2016 is located at position 12693 relative to the genome of Zaire Ebola virus (ZEBOV).

[28379] VGAM2030 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28380] An enzyme complex designated DICER COMPLEX, dices the VGAM2030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2030 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2030 RNA is designated SEQ ID:4741, and is provided hereinbelow with reference to the sequence listing part.

[28381] VGAM2030 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28382] VGAM2030 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2030 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2030 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28383] The complementary binding of VGAM2030 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2030 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2030 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28384] It is appreciated that VGAM2030 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2030 host target genes. The mRNA of each one of this plurality of VGAM2030 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2030 RNA, herein designated VGAM RNA, and which when bound by VGAM2030 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2030 host target proteins.

[28385] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2030 gene, herein designated VGAM GENE, on one or more VGAM2030 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28386] It is yet further appreciated that a function of VGAM2030 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2030 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2030 correlate with, and may be deduced from, the identity of the host target genes which VGAM2030 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28387] Nucleotide sequences of the VGAM2030 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2030 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2030 are further described hereinbelow with reference to Table 1.

[28388] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2030 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28389] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2031 (VGAM2031) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28390] VGAM2031 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2031 was detected is described hereinabove with reference to Figs. 2-8.

[28391] VGAM2031 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus

(ZEBOV). VGAM2031 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28392] VGAM2031 gene, herein designated VGAM GENE, encodes a VGAM2031 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2031 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2031 precursor RNA is designated SEQ ID:2017, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2017 is located at position 9873 relative to the genome of Zaire Ebola virus (ZEBOV).

[28393] VGAM2031 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[28394] An enzyme complex designated DICER COMPLEX, dices the VGAM2031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2031 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2031 RNA is designated SEQ ID:4742, and is provided hereinbelow with reference to the sequence listing part.

[28395] VGAM2031 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28396] VGAM2031 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2031 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28397] The complementary binding of VGAM2031 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2031 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28398] It is appreciated that VGAM2031 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2031 host target genes. The mRNA of each one of this plurality of VGAM2031 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2031 RNA, herein designated VGAM RNA, and which when bound by VGAM2031 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2031 host target proteins.

[28399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2031 gene, herein designated VGAM GENE, on one or more VGAM2031 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28400] It is yet further appreciated that a function of VGAM2031 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2031 correlate with, and may be deduced from, the identity of the host target genes which VGAM2031 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28401] Nucleotide sequences of the VGAM2031 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2031 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2031 are further described hereinbelow with reference to Table 1.

[28402] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2031 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28403] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2032 (VGAM2032) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28404] VGAM2032 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2032 was detected is described hereinabove with reference to Figs. 2-8.

[28405] VGAM2032 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2032 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28406] VGAM2032 gene, herein designated VGAM GENE, encodes a VGAM2032 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2032 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2032 precursor RNA is designated SEQ ID:2018, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2018 is located at position 2336 relative to the genome of Kyuri green mottle mosaic virus.

[28407] VGAM2032 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28408] An enzyme complex designated DICER COMPLEX, dices the VGAM2032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2032 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2032 RNA is designated SEQ ID:4743, and is provided hereinbelow with reference to the sequence listing part.

[28409] VGAM2032 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28410] VGAM2032 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2032 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2032 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28411] The complementary binding of VGAM2032 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2032 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28412] It is appreciated that VGAM2032 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2032 host target genes. The mRNA of each one of this plurality of VGAM2032 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2032 RNA, herein designated VGAM RNA, and which when bound by VGAM2032 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2032 host target proteins.

[28413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2032 gene, herein designated VGAM GENE, on one or more VGAM2032 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28414] It is yet further appreciated that a function of VGAM2032 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2032 include diagnosis, prevention and treatment of viral infection by Kyuri green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM2032 correlate with, and may be deduced from, the identity of the host target genes which VGAM2032 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28415] Nucleotide sequences of the VGAM2032 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2032 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2032 are further described hereinbelow with reference to Table 1.

[28416] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2032 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28417] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2033 (VGAM2033) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28418] VGAM2033 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2033 was detected is described hereinabove with reference to Figs. 2-8.

[28419] VGAM2033 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2033 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28420] VGAM2033 gene, herein designated VGAM GENE, encodes a VGAM2033 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2033 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2033 precursor RNA is designated SEQ ID:2019, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2019 is located at position 4726 relative to the genome of Zaire Ebola virus (ZEBOV).

[28421] VGAM2033 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28422] An enzyme complex designated DICER COMPLEX, dices the VGAM2033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2033 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2033 RNA is designated SEQ ID:4744, and is provided hereinbelow with reference to the sequence listing part.

[28423] VGAM2033 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[28424] VGAM2033 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2033 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2033 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28425] The complementary binding of VGAM2033 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2033 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28426] It is appreciated that VGAM2033 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2033 host target genes. The mRNA of each one of this plurality of VGAM2033 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2033 RNA, herein designated VGAM RNA, and which when bound by VGAM2033 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2033 host target proteins.

[28427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2033 gene, herein designated VGAM GENE, on one

or more VGAM2033 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28428] It is yet further appreciated that a function of VGAM2033 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2033 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2033 correlate with, and may be deduced from, the identity of the host target genes which VGAM2033 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28429] Nucleotide sequences of the VGAM2033 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2033 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2033 are further described hereinbelow with reference to Table 1.

[28430] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2033 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28431] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2034 (VGAM2034) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28432] VGAM2034 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2034 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[28433] VGAM2034 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2034 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28434] VGAM2034 gene, herein designated VGAM GENE, encodes a VGAM2034 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2034 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2034 precursor RNA is designated SEQ ID:2020, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2020 is located at position 3084 relative to the genome of Kyuri green mottle mosaic virus.

[28435] VGAM2034 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28436] An enzyme complex designated DICER COMPLEX, dices the VGAM2034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2034 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2034 RNA is designated SEQ ID:4745, and is provided hereinbelow with reference to the sequence listing part.

[28437] VGAM2034 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28438] VGAM2034 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2034 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[28439] The complementary binding of VGAM2034 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2034 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28440] It is appreciated that VGAM2034 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2034 host target genes. The mRNA of each one of this plurality of VGAM2034 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2034 RNA, herein designated VGAM RNA, and which when bound by VGAM2034 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2034 host target proteins.

[28441] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2034 gene, herein designated VGAM GENE, on one or more VGAM2034 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28442] It is yet further appreciated that a function of VGAM2034 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of viral infection by Kyuri green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM2034 correlate with, and may be deduced from, the identity of the host target genes which VGAM2034 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[28443] Nucleotide sequences of the VGAM2034 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2034 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2034 are further described hereinbelow with reference to Table 1.

[28444] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2034 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28445] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2035 (VGAM2035) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28446] VGAM2035 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2035 was detected is described hereinabove with reference to Figs. 2-8.

[28447] VGAM2035 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola virus (ZEBOV). VGAM2035 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28448] VGAM2035 gene, herein designated VGAM GENE, encodes a VGAM2035 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2035 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2035 precursor RNA is designated SEQ ID:2021, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2021 is located at position 12837 relative to the genome of Zaire Ebola virus (ZEBOV).
